century and a half due to their rich fossil record across 5 continents North America South America Europe Asia and Africa The recent horse has served a profound role in human ancestry including agriculture commerce sport transport warfare and in prehistory for the subsistence of humans Many studies have examined the evolution of the Equidae and chronicled the striking changes in skulls dentition limbs and body size which have long been perceived to be a response to environmental shifts through time Most comprehensive studies heretofore have 1 focused on the Great Transformation changes that occurred in the early Miocene 2 involved tracking long term diversity or paleoecological trends on a single continent or within a geographical locality or 3 concentrated on the 3 toed hipparions The Plio Pleistocene evolutionary stage of horse evolution is punctuated by the great climatic fluctuations of the Quaternary beginning 2.6 Ma which influenced Equus evolution biogeographic dispersion and adaptation on a nearly global scale The evolutionary biology of Equus evolution across its entire range remains relatively poorly understood and often highly controversial Some of this lack of understanding is due to assumptions that have arisen because of the relatively derived craniodental and postcranial anatomy of Equus and its close relatives which has seemed to imply that that these forms occupied relatively homogenous and narrow dietary and locomotor niches notions that have not been adequately addressed and rigorously tested Other challenges have revolved around teasing apart environmentally driven adaptation versus phylogenetically defined morphological change Geochronologic age control of localities geographic provinces and continents has improved but in no way is absolute and can be reexamined in our proposed volume Temporal resolution for paleodietary paleohabitat and paleoecological interpretations are also challenging for understanding the evolution of Equus Our proposed volume attempts to assemble a group of experts who will address multiple dimensions of Equus evolution in time and space

**The Past and the Future of Human Immunity Under Viral Evolutionary Pressure** Gkikas Magiorkinis, Tara P. Hurst, 2019-12-04 There is a long standing evolutionary battle between viruses and their hosts that continues to be waged The evidence of this conflict can be found on both sides with the human immune system being responsive to new viral challenges and viruses having developed often sophisticated countermeasures The arms race between viruses and hosts can be thought as an example of the Red Queen race an evolutionary hypothesis inspired from the dialogue of Alice with the Red Queen in Lewis Carroll's Through the Looking Glass At the same time viruses have a minimal genomic content as they have evolved to hitchhike biological machinery of their hosts or other co infecting viruses The minimalistic viral genome could be thought as the result of a Black Queen evolution a theory inspired from the card game Hearts where the winner is the one with the fewest points at the end The effects of this arms race are evident in the evolution of the human immune system This system is capable of responding to diverse viral

challenges utilizing both the ancient innate immune system and the more recently evolved adaptive immune system of jawed vertebrates. It is now well known that the two systems are linked with innate immunity hypothesized to have provided raw material for the emergence of the adaptive immune response. The adaptive immune response comprises several protein families including B and T cell receptors, MHC and KIR proteins, for example, that are encoded by complex and variable genomic regions. This complexity enables for responsive genetic changes to occur in immune cells such as the ability of genomic hypervariable regions in B cells to recombine in order to produce more specific antibodies. Indeed, the human immune system is thought to be continually evolving via various mechanisms such as changes in the genes encoding immune receptors and the regulatory sequences that control their expression. For example, there is some evidence that exogenous viral infections can alter the expression of endogenous retroviruses, some of which contribute to the immune response. Viral countermeasures can include encoding decoy receptors for the signalling molecules of the immune response, altering the gene expression of adaptive immune cells during chronic infection, or using host enzymes to facilitate viral immune escape. As the articles herein show, the immune system continues to be challenged by viral infections, and these challenges continue to shape how the immune system combats pathogens; thus, viruses and human immunity are continuously part of Red and Black Queen evolutionary dynamics. We had the pleasure of working with Jonas Blomberg as a reviewer during the course of the Research Topic, and his untimely passing was a great loss. Prof. Blomberg made significant contributions, including to the nomenclature of endogenous retroviruses (ERVs), the evolution and characterization of specific human ERV (HERV), and the contribution of ERVs to diseases such as cancer. It is with great respect for his contributions to the ERV field that we dedicate this eBook to his memory.
