**Functional Characterization of Insect Chemoreceptors: Receptivity Range, Expression and Evolution** William B. Walker,Emmanuelle Jacquin-Joly,Sharon R. Hill,2016-06-11 Olfaction and taste are of critical importance to insects and other

animals since vital behaviours including mate food and host seeking as well as predator and toxin avoidance are guided by chemosensory cues Mate and habitat choice are to a large extent determined by chemical signals and chemoreceptors contribute accordingly to pre mating isolation barriers and speciation In addition to fundamental physiological ecological and evolutionary consideration the knowledge of insect taste and especially olfaction is also of great importance to human economies since it facilitates a more informed approach to the management of insect pests of agricultural crops and forests and insect vectors of disease Chemoreceptors which bind to external chemical signals and then transform and send the sensory information to the brain are at the core of the peripheral olfactory and gustatory system and have thus been the focus of recent research in chemical ecology Specifically emphasis has been placed on functional characterization of olfactory receptor genes which are derived from three large gene families namely the odorant receptors gustatory receptors and ionotropic receptors Spatial expression patterns of olfactory receptors in diverse chemosensory tissues provide information on divergent functions with regards to ecologically relevant behaviours On the other hand characterization of olfactory receptor activation profiles or deorphanization provides complimentary data on the molecular range of receptivity to the fundamental unit of the olfactory sense The aim of this Research Topic is to give an update on the breadth and depth of research currently in progress related to understanding the molecular mechanisms of insect chemoreception with specific emphasis on the olfactory receptors

*Advances in Insect Control and Resistance Management* A. Rami Horowitz, Isaac Ishaaya, 2016-08-26 This book covers advanced concepts and creative ideas with regard to insect biorational control and insecticide resistance management Some chapters present and summarize general strategies or tactics for managing insect pests such as the principles of IPM in various crop systems and biorational control of insect pests advances in organic farming alternative strategies for controlling orchard and field crop pests Other chapters cover alternative methods for controlling pests such as disruption of insect reproductive systems and utilization of semiochemicals and diatomaceous earth formulations and developing bioacoustic methods for mating disruption Another part is devoted to insecticide resistance mechanisms and novel approaches for managing insect resistance in agriculture and in public health

tools in each individual food legume Development of innovative biotechnological tools genetic transformation and the genome sequencing information has also been covered in each chapter providing the readers with state of the art information on pulses All chapters have been supported by relevant figures illustrations and tables which make the contents accessible and easy to understand Each of the chapters has been authored by globally known scientists researchers presenting up to date information on various aspects of food legumes This book provides a current and comprehensive treatise to the readers and will be tremendously helpful in furthering their academic and research pursuits Provides a single volume resource on the most important food legumes having a prominent role in food and nutritional security Written by experts with a focus on providing foundational information for further research and development Presents both theoretical aspects and application based case studies Supported by relevant figures illustrations and tables *Integrated management of diseases and insect pests of tree fruit* Professor Xiangming Xu, Dr Michelle Fountain, 2019-09-10 Comprehensive review of current research on the causes of major fungal bacterial and viral diseases of tree fruit Summarises current understanding of the ecology of key insect pests of tree fruit Assesses ways of improving integrated disease and pest management with a particular focus on biological control **Crop Traits for Defense Against Pests and Disease: Durability, Breakdown and Future**

**Prospects, 2nd Edition** Alison J. Karley, Scott N. Johnson, Rex Brennan, Peter J. Gregory, 2019-04-17 With global populations expected to exceed 9.2 billion by 2050 and available land and water resources devoted to crop production dwindling we face significant challenges to secure global food security Only 12 plant species feed 80% of the world's population with just three crop species wheat rice and maize accounting for food consumed by 50% of the global population Annual losses to crop pests and pathogens are significant thought to be equivalent to that required to feed a billion people at a time when crop productivity has plateaued With pesticide applications becoming increasingly unfeasible on cost efficacy and environmental grounds there is growing interest in exploiting plant resistance and tolerance traits for crop protection Indeed mankind has been selectively breeding plants for desirable traits for thousands of years However resistance and tolerance traits have not always been those most desired and in many cases have been inadvertently lost during the domestication process crops have been effectively disarmed by domestication Moreover mechanistic understanding of how resistance and tolerance traits operate is often incomplete which makes identifying the right combination for crop protection difficult We aimed to address this Research Topic by inviting authors to contribute their knowledge of appropriate resistance and tolerance traits explore what is known about durability and breakdown of defensive traits and finally asking what are the prospects for exploiting these traits for crop protection The research topic summarised in this book addresses some of the most important issues in the future sustainability of global crop production
