

Introduction

SOLAR SYSTEM FORMATION

- On Earth, we have heavier elements that can only form in the nucleus of stars.
 - Proves the theory that our solar system must have been formed from the presence of previous supernovae
- Gravity pulled particles close together to rotate faster.
 - The center of the cosmic cloud had high temperature and pressure, creating nuclear reactions
 - The particles began to move closer together and accrete, creating planets
- Our moon formed from a mars-sized planet and a proto-Earth that collided with the Earth, having the moon spin off into space and be created
- Massive gap between Mars and Jupiter could be explained by the asteroid belt that was never created

When the Earth first formed:

- It was mostly molten
- No hard crust whatsoever
- We used to be fully liquid, which allowed us to create a differentiation in layers as well as the formation of crust and an iron core
- For most of Earth's history, life was unicellular.
 - Then eukaryotic cells appeared and the demand for oxygen to respire was created, forming multicellular life

Be able to predict how gravitational force changes with mass or distance and explain how it resulted in the creation of the Earth

The force due to Gravity

$$F = G \frac{m_1 m_2}{R^2}$$

- G = a constant (gravitational constant)
- m_1 = the mass of one body
- m_2 = the mass of a second body
- R = the distance between them

- Gravity is a pretty weak force.
 - This is how we are able to jump
 - However, they can act over incredibly long distances
- The Earth was created on a spatial and temporal scale.
 - Rock cycles, the biosphere, etc. all took time to create the Earth

Practice Questions:

1. Approximately how old is our solar system?
a. 4.5 billion years
2. The gravitational force between two objects = F . If I double the distance between these two objects, the amount of gravitational force they now experience is:
a. $1/4F$
