The book is useful for dealing with situations where there is a model relating to the input and output of a process but with a random component which could be noise in the system or the process itself could be random like turbulence. Parameter estimation techniques are shown for many different types of statistical models including joint Gaussian. The Cramer Rao bounds are described as useful estimates of reproducibility errors. Finally, using an example with a random sampling of turbulent flows that can occur when using laser anemometry, the book also explains the use of conditional probabilities.
