successful ADBIS conferences include the ADBIS 93 and ADBIS 94 Workshops that took place in Moscow. The aims of these workshops are to provide a forum for the presentation and in depth discussion of advanced research directions that will effectively improve the building and use of future information systems and to increase communication between the Eastern and Western research communities which were formerly separated and still have only rare possibilities to interact. Improving of the contacts and exchange of ideas between researchers from the East and from the West will eventually lead to better collaboration between them. The ADBIS 95 Call for Submissions attracted 60 submissions from 15 countries of which 35 submissions were accepted for presentation at the regular sessions 9 as posters and 7 as presentations for a special session for the Information Systems for Science. This volume contains the papers presented in the regular sessions.

High Voltage Devices and Circuits in Standard CMOS Technologies Hussein Ballan, Michel Declercq, 1998-10-31 Standard voltages used in today's ICs may vary from about 1.3V to more than 100V depending on the technology and the application. High voltage is therefore a relative notion. High Voltage Devices and Circuits in Standard CMOS Technologies is mainly focused on standard CMOS technologies where high voltage HV is defined as any voltage higher than the nominal low voltage i.e. 5V, 3.3V or even lower. In this standard CMOS environment IC designers are more and more frequently confronted with HV problems particularly at the I/O level of the circuit. In the first group of applications a large range of industrial or consumer circuits either require HV driving capabilities or are supposed to work in a high voltage environment. This includes ultrasonic drivers, flat panel displays, robotics, automotive etc. On the other hand in the emerging field of integrated microsystems MEMS actuators mainly make use of electrostatic forces involving voltages in the typical range of 30 to 60V. Last but not least with the advent of deep sub micron and/or low power technologies the operating voltage tends towards levels ranging from 1V to 2.5V while the interface needs to be compatible with higher voltages such as 5V. For all these categories of applications it is usually preferable to perform most of the signal processing at low voltage while the resulting output rises to a higher voltage level. Solving this problem requires some special actions at three levels: technology, circuit design and layout. High Voltage Devices and Circuits in Standard CMOS Technologies addresses these topics in a clear and organized way. The theoretical background is supported by practical information and design examples. It is an invaluable reference for researchers and professionals in both the design and device communities.
