measures to shield domestic automotive enterprises from pro market reforms The formation of the national car project marks a turning point for Malaysia s industrial development as a country which it envisions will lead to it becoming a major player in the global automotive market However the domestic institutional factors embedded in ethno economic interests and patronage constrain national car makers limiting their potential to grow and instead causing a slowdown in the industry Allowing readers to understand the background to Malaysia s heavy industrialisation programme and the birth of its national car projects this book critically discusses the significance of institutional context in policy outcomes and highlights how institutions and policies have impact growth or decline It is a valuable resource relevant to analysts researchers and students who are interested in the political economy of the national industrial policy and automotive industry in Malaysia and beyond

Theory and Practice of Model Transformations Davide Di Ruscio,Daniel Varró,2014-07-05 This book constitutes the refereed proceedings of the 7th International Conference on Model Transformation ICMT 2014 held in York UK in July 2014 The 14 revised papers were carefully selected from 38 submissions The papers have been organized in topical sections on model transformation testing foundations of model synchronization applications of model synchronization and tracing and reverse engineering of transformations *Climate Change 2014: Mitigation of Climate Change* Intergovernmental Panel on Climate Change,2015-01-26 This latest Fifth Assessment Report of the Intergovernmental Panel on Climate Change IPCC will again form the standard reference for all those concerned with climate change and its consequences including students researchers and policy makers in environmental science meteorology climatology biology ecology atmospheric chemistry and environmental policy **The Economics of Oil** S.W. Carmalt,2016-12-26 This book examines the ways that oil economics will impact the rapidly changing global economy and the oil industry itself over the coming decades The predictions of peak oil were both right and wrong Oil production has been constrained in relation to demand for the past decade with a resulting four fold increase in the oil price slowing the entire global economy High oil prices have encouraged a small increase in oil production and mostly from the short lived fracking revolution but enough to be able to claim that peak oil was a false prophecy The high oil price has also engendered massive exploration investments but remaining hydrocarbon stocks generally offer poor returns in energy the energy return on investment or EROI and financial terms and no longer replace the reserves being produced As a result the economically powerful oil companies are under great pressure both financially and politically as oil remains the backbone of the global economy div Development scenarios and political pressure for growth as a means of solving economic woes both require more net energy which is the amount of energy available after energy and thus financial inputs required for new sources to come on line are deducted In today s economy more energy usually means more oil Although a barrel of oil from any source may look the same tight oil and oil from tar sands require much higher prices to be profitable for the producer these expensive sources have very different economic implications from the conventional oil supplies that underpinned economic growth for most of the 20th century The role of oil in the global

economy is not easily changed Since currently installed infrastructure assumes oil a change implies more than just substitution of an energy source The speed with which such basic structural changes can be made is also constrained and ultimately themselves dependent on fossil fuel inputs It remains unclear how this scenario will evolve and that uncertainty adds additional economic pressure to the investment decisions that must be made Drill baby drill and new pipeline projects may be attractive politically but projections of economic and associated oil production growth based on past performance are clearly untenable

Ditlev-Simonsen,2021-12-14 This open access book discusses the challenges and opportunities faced by companies in an age that increasingly values sustainability and demands corporate responsibility Beginning with the historical development of corporate responsibility this book moves from academic theory to practical application It points to ways in which companies can successfully manage their transition to a more responsible sustainable way of doing business common mistakes to avoid and how the UN Sustainable Development Goals are integral to any sustainability transformation Practical cases illustrate key points Drawing on thirty years of sustainability research and extensive corporate experience the author provides tools such as a Step by Step strategic guide on integrating sustainability in collaboration with stakeholders including employees customers suppliers and investors The book is particularly relevant for SMEs and companies operating in emerging markets From a broader perspective the value of externalities full cost pricing alternative economic theories and circular economy are also addressed *Constructing European Union Trade Policy* Gabriel Siles-Brügge,2014-02-18 With the stagnation of the Doha Round of multilateral talks trade liberalisation is increasingly undertaken through free trade agreements Gabriel Siles Br gge examines the EU s decision following the 2006 Global Europe strategy to negotiate such agreements with emerging economies Eschewing the purely materialist explanations prominent in the field he develops a novel constructivist argument to highlight the role of language and ideas in shaping EU trade policy Drawing on extensive interviews and documentary analysis Siles Br gge shows how EU trade policymakers have privileged the interests of exporters to the detriment of import competing groups creating an ideational imperative for market opening Even during the on going economic crisis the overriding mantra has been that the EU s future well being depends on its ability to compete in global markets The increasingly neoliberal orientation of EU trade policy has also had important consequences for its economic diplomacy with the developing economies of the African Caribbean and Pacific group of states **Important Factors for Accurate Scale-Resolving Simulations of Automotive Aerodynamics** Petter Ekman,2020-04-02 Road transports are responsible for almost 18 % of the greenhouse gas emission in Europe and are today the leading cause of air pollution in cities Aerodynamic resistance has a significant effect on fuel consumption and hence the emission of vehicles For electric vehicles emissions are not affected by the aerodynamics as such but instead have a significant effect on the effective range of the vehicle In 2017 a new measurement procedure was introduced Worldwide Harmonized Light Vehicles Test Procedure WLTP for measuring emissions fuel consumption and range This procedure

includes a new test cycle with increased average driving speed compared to the former procedure which thereby increases the importance of the aerodynamic resistance as it drastically increases with speed. A second effect is that the exact car configuration sold to the customer needs to be certified in terms of fuel consumption and emissions. The result is that every possible combination of optional extras which might affect the aerodynamic resistance needs to be aerodynamically analyzed and possibly improved. From 2021 the European Commission will introduce stricter emission regulations for new passenger cars with the fleet wide average lowered to 95 grams CO₂/km which puts an even higher demand on achieving efficient aerodynamics. Virtual development of the aerodynamics of road vehicles is today used to a great extent using Computational Fluid Dynamics as it enables faster and cheaper development. However, achieving high accuracy for the prediction of the flow field and aerodynamic forces is challenging, especially given the complexity of both the vehicle geometry in itself and the surrounding flow field. Even for a simplified generic bluff body, accurately predicting the flow field and aerodynamic forces is a challenge. The main reason for this challenge of achieving results with high accuracy is the prediction of the complex behavior of turbulence. Scale resolving simulation (SRS) methods such as Large Eddy Simulation (LES) where most of the turbulent structures are resolved, has in many studies shown high accuracy but unfortunately to a very high computational cost. It is primarily the small turbulent structures within the near wall region that requires a fine resolution in both space, the mesh, and in time. This fine resolution is the reason for the very high computational cost and makes LES unfeasible for practical use in industrial aerodynamic development at present and in the near future. By modeling the turbulent structures within the near wall region using a Reynolds Averaged Navier Stokes (RANS) model and resolving the turbulence outside the region with a LES model, a coarser resolution is possible, resulting in significantly lower computational cost. Which used RANS model is of high importance and especially how much turbulent viscosity the model generates as too high values can result in suppression of the resolved turbulence. The transitioning between the RANS and LES regions have a significant effect on the results. Faster transition enables more resolved turbulence, favorable for higher accuracy but needs to be balanced with sufficient shielding of the RANS region. If resolving the turbulence occurs within the near wall region and the mesh is not sufficiently fine, it can result in poor accuracy. By increasing the time step size and disregarding best practice guides, the computational cost can be significantly reduced. The accuracy is reasonably insensitive to the larger time step sizes until a certain degree, thereby enabling computationally cheaper SRS to achieve high accuracy of aerodynamic predictions needed to meet present and future emission regulations.
