QUESTION		ANSWER	
What is the effect of the following factors on the rate of reaction?		Temperature: As temperature increases, the rate of reaction increases. This is because the molecules have more kinetic energy and are more likely to collide with sufficient energy to overcome the activation energy barrier.	
What is the effect of the following factors on the rate of reaction?		Concentration: As concentration increases, the rate of reaction increases. This is because there are more reactant molecules per unit volume, leading to a higher frequency of collisions.	
What is the effect of the following factors on the rate of reaction?		Surface area: As surface area increases, the rate of reaction increases. This is because a larger surface area provides more sites for reactant molecules to collide.	
What is the effect of the following factors on the rate of reaction?		Catalyst: A catalyst increases the rate of reaction by providing an alternative reaction pathway with a lower activation energy.
