The purpose of this research was to identify effective strategies for dealing with repetitive motions identified in individuals with Autism Spectrum Disorder. Based on the analysis conducted, it can be concluded that there are multiple behavior modification therapies important for the improvement of this behavior. Future experimentation into behavior modification techniques could be useful to find further therapy techniques. The amount this could improve the lives of others with repetitive motion behaviors is worth exploring.

full set during only a part of their childhood When they are babies and toddlers children have less than 20 visible teeth and as they grow older children begin to lose their deciduous teeth which are then replaced by permanent teeth Children have 20 deciduous baby teeth is not even a complete scientific statement For one thing the statement children have 20 deciduous teeth does not tell us what we mean by teeth When we say teeth do we mean only those that can be seen with the unaided eye or do we also include the hidden unerupted teeth An observation such as children have 20 deciduous teeth is not a fact and by itself it is not acceptable as a scientific statement until its terms are explained scientifically children have 20 deciduous teeth must be accompanied by definitions and qualifiers
