

Chapter 11 Study Guide

Muscular System

1. Describe the function of a prime mover, antagonist, synergist, and fixator.
 - Prime mover: principal muscle that performs action
 - Synergist: assists the agonist muscle or "primary mover" for a specific action at a joint.
 - Fixator: serves as a stabilizer of one part of the body during movement of another part.
2. List the criteria used in naming muscles and provide an example to illustrate each.
 - Shape, size, location in the body, location of the attachment points, number of origin, action, direction.

Example: shape: deltoid, size: gluteus maximus, location in body: biceps femoris, location of the attachment: sternocleidomastoid, number of origin: triceps, action: supinator, direction: transversus abdominis
3. Name the common patterns of muscle fascicle arrangement and provide an example to illustrate each.
 - Common patterns of muscle fascicle: parallel, circular, convergent, pennate,
 - Parallel: sartorius circular: orbicularis oris, convergent: pectoralis major, pennate: rectus femoris
4. Name and describe the components of a lever system.
 - Lever, fulcrum, effort, load
 - Mechanical advantage: Mechanical advantages allows humans to perform tasks much easier in terms of the force they need to apply, but must always obey the conservation of energy.
 - Mechanical disadvantage: When a lever's load arm is longer than its effort arm, it is said to be at a mechanical disadvantage. It has a low load force to effort ratio.
5. Differentiate between a lever designed for speed versus power.
 - The speed lever (third-class) is the most common type of lever system in the body. Applied force is located between the load and the fulcrum
 - The power lever (second class) Load lies between the applied force and the fulcrum
6. Differentiate between a first class, second class, and third class lever and give an example of each.
 - First class lever: function: provide a way for the body to change the direction, speed, and strength of movement at a joint. example: the head and neck during neck extension.
 - Second class lever: function: the load is in the middle between the fulcrum and the effort. example: standing on tip toes
 - Third class lever: differs from the second-class lever in that the distribution of forces is changed in relation to the fulcrum. Example: elbow joint
7. What 4 muscles make up the quadriceps?
 - Rectus femoris, Vastus lateralis, Vastus medialis, Vastus intermedius
8. What 3 muscles make up the hamstring?
 - semitendinosus, semimembranosus, and biceps femoris

Muscular System (Speedy Study Guides) Speedy Publishing, 2014-06-21 The muscular system is the network of body tissue or muscle bands that are formed over your skeleton frame. The muscles in conjunction with the skeleton and the body's nervous system work together to move the body and guide it through various activities and positions. Certain muscles are more dense than others as a result of certain activities such as cycling or weightlifting which helps develop the thighs or arms and which are expected to carry heavier loads. A chart of the muscular system would be beneficial in helping one understand what muscles are located where in the human body. If one seeks to improve their ability in a particular function the chart will assist in describing which muscles to train.

Muscular System (Blokehead Easy Study Guide) The Blokehead, 2015-06-10 The muscular system is an intricate biological work that consists of interrelated molecular, cellular, histological, and organ activities. Each muscular function is determined by the type, form, and size of the muscular tissues.
