HOW TO MAKE SURE WHEEL NUTS ARE PROPERLY TIGHTENED

Abstract: The purpose of this study was to determine the effect of a 12-week training program on the physical and physiological characteristics of young women. The subjects were 15 young women (mean age 20.5 years) who participated in a 12-week training program. The training program consisted of three sessions per week, each lasting 45 minutes. The first session was a warm-up, the second session was a cardiovascular workout, and the third session was a strength training workout. The subjects were tested at the beginning and end of the training program. The results showed that the subjects had a significant increase in their maximum heart rate, maximum oxygen consumption, and maximum power output. There was no significant change in their resting heart rate, resting oxygen consumption, or resting power output. The subjects also had a significant increase in their body mass index (BMI) and a significant decrease in their body fat percentage. The results of this study suggest that a 12-week training program can improve the physical and physiological characteristics of young women.
