Atluri, A.K. Amos, 2012-12-06 This monograph is intended to provide a snapshot of the status and opportunities for advancement in the technologies of

dynamics and control of large flexible spacecraft structures. It is a reflection of the serious dialog and assessments going on all over the world across a wide variety of scientific and technical disciplines as we contemplate the next major milestone in mankind's romance with space: the transition from exploration and experimentation to commercial and defense exploitation. This exploitation is already in full swing in the space communications area. Both military and civilian objectives are being pursued with increasingly more sophisticated systems such as large antenna reflectors with active shape control. Both the NATO and Warsaw pact alliances are pursuing permanent space stations in orbit, large structural systems whose development calls for in situ fabrication and/or assembly and whose operation will demand innovations in controls technology. The last ten years have witnessed a fairly brisk research activity in the dynamics and control of large space structures in order to establish a technology base for the development of advanced spacecraft systems envisioned for the future. They have spanned a wide spectrum of activity from fundamental methods development to systems concept studies and laboratory experimentation and demonstrations. Some flight experiments have also been conducted for various purposes such as the characterization of the space environment, durability of materials and devices in that environment, assembly and repair operations and the dynamic behavior of flexible structures. It is this last area that has prompted this monogram.

**Mathematics Applied to Engineering, Modelling, and Social Issues** Frank T. Smith, Hemen Dutta, John N. Mordeson, 2019-03-14. This book presents several aspects of research on mathematics that have significant applications in engineering, modelling and social matters, discussing a number of current and future social issues and problems in which mathematical tools can be beneficial. Each chapter enhances our understanding of the research problems in a particular area of study and highlights the latest advances made in that area. The self-contained contributions make the results and problems discussed accessible to readers and provides references to enable those interested to follow subsequent studies in still developing fields. Presenting real world applications, the book is a valuable resource for graduate students, researchers and educators. It appeals to general readers curious about the practical applications of mathematics in diverse scientific areas and social problems.

**Constrained Optimal Control of Linear and Hybrid Systems** Francesco Borrelli, 2003-09-04. Many practical control problems are dominated by characteristics such as state input and operational constraints, alternations between different operating regimes and the interaction of continuous time and discrete event systems. At present, no methodology is available to design controllers in a systematic manner for such systems. This book introduces a new design theory for controllers for such constrained and switching dynamical systems and leads to algorithms that systematically solve control synthesis problems. The first part is a self-contained introduction to multiparametric programming, which is the main technique used to study and compute state feedback optimal control laws. The book's main objective is to derive properties of the state feedback solution as well as to obtain algorithms to compute it efficiently. The focus is on constrained linear systems and constrained linear hybrid systems. The applicability of the theory is demonstrated.
