Palmer, Joy B. Zedler, 2013-03-19 As the practical application of ecological restoration continues to grow there is an increasing need to connect restoration practice to areas of underlying ecological theory Foundations of Restoration Ecology is an important milestone in the field bringing together leading ecologists to bridge the gap between theory and practice by translating elements of ecological theory and current research themes into a scientific framework for the field of restoration ecology Each chapter addresses a particular area of ecological theory covering traditional levels of biological hierarchy such as population genetics demography community ecology as well as topics of central relevance to the challenges of restoration ecology such as species interactions fine scale heterogeneity successional trajectories invasive species ecology ecophysiology Several chapters focus on research tools research design statistical analysis modeling or place restoration ecology research in a larger context large scale ecological phenomena macroecology climate change and paleoecology evolutionary ecology The book makes a compelling case that a stronger connection between ecological theory and the science of restoration ecology will be mutually beneficial for both fields restoration ecology benefits from a stronger grounding in basic theory while ecological theory benefits from the unique opportunities for experimentation in a restoration context Foundations of Restoration Ecology advances the science behind the practice of restoring ecosystems while exploring ways in which restoration ecology can inform basic ecological questions It provides the first comprehensive overview of the theoretical foundations of restoration ecology and is a must have volume for anyone involved in restoration research teaching or practice     **Introduction to Population Ecology** Larry L. population theory has developed followed by descriptions of laboratory and field studies that have been inspired by the theory Topics explored include single species population growth and self limitation life histories metapopulations and a wide range of interspecific interactions including competition mutualism parasite host predator prey and plant herbivore An additional final chapter new for the second edition considers multi trophic and other complex interactions among species Throughout the book the mathematics involved is explained with a step by step approach and graphs and other visual aids are used to present a clear illustration of how the models work Such features make this an accessible introduction to population ecology essential reading for undergraduate and graduate students taking courses in population ecology applied ecology conservation ecology and conservation biology including those with little mathematical experience **Infectious**
