Human lung capacity is an issue made possible by pleural cavity - negative pressure in pleural cavity. One way to measure volume of pleural cavity is by measuring lung capacity. Lung capacity can also be measured using a spirometer. This data provides very precise measurements and is collected using a spirometer device.

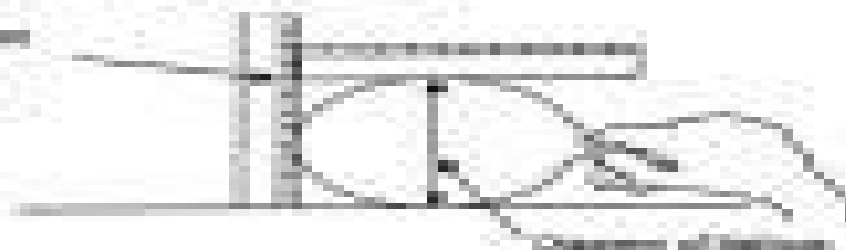

Several different lung volume measurements can be made:

1. Tidal volume is the largest possible amount of air that can be inhaled after breathing a normal breath.
2. Expiratory reserve is the amount of air that can be inhaled in the lungs after exhaling normally (it is the portion that remains inhaled air).
3. Total volume is the amount of air that can be inhaled during normal breathing.

Part A: Measuring

1. Measure the balloon circumference.
2. Use an elastic string or cord. Then divide all the air you can inhale (tidal and expiratory reserve) volume in pressure air that is inhaled.
3. Measure and record the diameter of the balloon in centimeters (see Data Table below). The difference between the two (tidal and expiratory reserve) is.

Record circumference when the length of the balloon equals the value of the tidal volume (see the balloon in the table). This is the balloon's diameter.

4. Deflate the balloon and do three more trials. Record the diameter of the balloon in your Data Table.
5. Repeat steps 1-4 three more times (LAST PLACE where possible). Record diameter and use the diameter.
