

MUSHROOM LIFE CYCLE

In order to reproduce, many fungi form fruitbodies, or what we know as mushrooms. While plants grow from seeds, mushrooms grow from spores—tiny dust-like specks released from a mushroom's gills or pores. When spores land on the right growing material (or substrate) it's called inoculation.

The spores germinate and start making threads of mycelium called hyphae. These mate with other compatible hyphae to form a dikaryon. Dikaryotic mycelium contains genes from both parents, giving it the ability to form mushrooms.

As the mycelium grows and branches out it seeks nutrients and creates enzymes and compounds to protect itself. The substrate is colonized by mycelium. Once the mycelium has absorbed enough food, clumps of mycelium condense into a hyphal knot.

From this a pinhead or primordia forms (baby mushroom).

The mushroom matures into a full fruitbody, releasing spores to start the cycle all over again.
