FEMALE REPRODUCTIVE SYSTEM

comprises the : owneries. genital ducts fallopian tube utterus wagina

external genitalia

mammary glands are impt glands although it is considered not one of the genital organs

Functions:

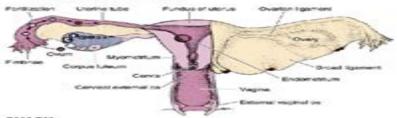

production of female gametes (ova)

reception of male gametes (spermatozoa)

provision of a suitable environment for fertilization

development of the fetus and its expulsion

nutrition of the newborn

OVARY

- glands of double function (exocrine and endocrine)
- flattened ovoid bodies suspended on either side of the uterus on the lateral wall of the pelvic cavity
- surface is covered by a simple squamous or cuboidal epithelium, the germinal epithelium

tunica albuginea

layer of dense CT beneath the epithelium which increases in density with advancing age

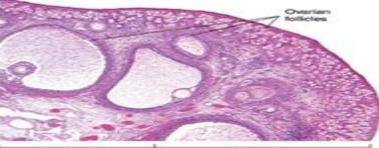

- cortex
- -- outer thick portion medulla (zona vasculosa) -- inner thin portion
- large convoluted, spiral thick walled blood vessels.
- stroma have scattered strands of smooth muscle fibers

Berger's cells (hilus cells)

- formerly named sympathicotrophic hilus glends
- similar to the Leydig cells of the testis tumor of hyperplasia of the ovarian hilus-
- → masculinizing characteristics

Cortex

- CT cells are abundant, large, fusiform-shaped
- stroma consists of spindle-shaped cells displays swirfy appaerance
 - dispersed stromal cells interstitial glands

Modullary region

Cortical negion

Wondershare PDFelement Remove Watermark

- Primordial Follicle (unifaminar)
- big spherical cell, the ovum, surrounded by a layer of smaller flattened cells called the follicular or granulosa CONTRA

Theca folliculi

- condensation of dense CT around the follicle
- oocyte has a large, eccentrically placed nucleus with a large nucleolus, well developed Golgi apparatus, surrounded by numerous small mitochondria

Primary Ovarian Follide

- growth and differentiation of the ovum
- proliferation of follicular cells
 - (flattened cells becomes cuboidal or low columnar)
- gives rise to multiple Golgi complex dispersed in the cytoplasm located at the periphery near the cell membrane or opleme

Theca follouli differentiates into:

- a) thece interne highly vascular inner layer of secretory cells
- thece externe outer layer composed of CT

Zona pellucida

- amorphous material deposited around the microvilli containing mucoprotein substance
 - elaborated probably by the granulose cells

Secondary Follicle (antral)

- irregular small space filled with a clear fluid causes further increase in the size of the follicle
- oocyte has attained its full size by the time of formation of the antrum begins

Antrum

single cavity within the follicle formed from the fusion of small spaces filled with fluid during the proliferation of follicular cells

Cumulus oophorus

- eccentric mound or hillock
- Rs followlar cells is directly in relation to the ovum becomes radially arranged and form the corona radiata, separated from the ovum only by zona pellucida

Membrana granulosa

regular continuous layer around the antral cavity formed by the stratified epithelium

Call-Exper bodies

small accumulations of densely staining material that appear among the granulosa cells with a (+) PAS reaction seen to be extracellular in E/M

Mature Follicle (grafflan)

- large oocyte with large nucleus and prominent nucleolii
- large antrum is distended with fluid bound by membrane granulose
- ovum has attained it full size surrounded by thick zona pellucida and a characterístic corona radiata

Macula Pellucida (stigma)

- tunica albuginea & theca follouli become attenuated
- granulose cells lining the mature follicle constitute a stratified cuboidal epithelium
- theca folliculi reaches its greatest development.

theca interna

- has large spindle-shaped or polyhedral cells with oval nuclei and fine lipid droplets in cytoplasm
- principally responsible for elaboration of female
- sex hormones, estrogen
