**Immunology** Richard J. Simpson,Shlomit Radom-Aizik,Forrest Lee Baker,Guillaume Spielmann,Ana Maria Teixeira,Erik D. Hanson,Brandt D. Pence,2024-04-18 Maintaining optimal immune function is at the cornerstone of disease prevention and management The realization that lifestyle factors such as exercise nutrition sleep and stress can be targeted to optimize immune function for the prevention and treatment of illness and disease has intensified among physicians and health care providers Exercise immunology as a discipline came to the fore in the early 1990 s through formation of the International Society of Exercise and Immunology ISEI Since then several major advances have been made including the understanding that i physical activity is associated with fewer incidences and symptoms of infection ii every bout of exercise facilitates the ongoing exchange of immune cells between the blood and tissues to increase immune surveillance iii regular exercise lowers chronic low grade inflammation and improves vaccine responses in the elderly iv contracting skeletal muscle acts as an immune regulatory organ v physical activity can improve immune markers in aging and multiple disease states e g cancer HIV diabetes vi exercise expedites infection resolution and restricts host pathogen entry and dissemination

**Oncogenesis** James DeGregori,2018-03-09 Popular understanding holds that genetic changes create cancer James DeGregori uses evolutionary principles to propose a new way of thinking about cancer s occurrence Cancer is as much a disease of evolution as it is of mutation one in which mutated cells outcompete healthy cells in the ecosystem of the body s tissues His theory ties cancer s progression or lack thereof to evolved strategies to maximize reproductive success Through natural selection humans evolved genetic programs to maintain bodily health for as long as necessary to increase the odds of passing on our genes but not much longer These mechanisms engender a tissue environment that favors normal stem cells over precancerous ones Healthy tissues thwart cancer cells ability to outcompete their precancerous rivals But as our tissues age or accumulate damage from exposures such as smoking normal stem cells find themselves less optimized to their ecosystem Cancer causing mutations can now help cells adapt to these altered tissue environments and thus outcompete normal cells Just as changes in a species habitat favor the evolution of new species changes in tissue environments favor the growth of cancerous cells DeGregori s perspective goes far in explaining who gets cancer when it appears and why While we

cannot avoid mutations it may be possible to sustain our tissues natural and effective system of defense even in the face of aging or harmful exposures For those interested in learning how cancers arise within the human body the insights in Adaptive Oncogenesis offer a compelling perspective      *The Role of Metabolism in Stem Cell Fates* Anthony Scimè,Mireille Khacho,2022-01-21      *Protein Kinases in Development and Disease* ,2017-02-22 Protein Kinases in Development and Disease discusses and reviews important but often neglected kinases A good representation of current model organisms from plants and C elegans to mice are used as the basis to illustrate how we can use our understanding of normal development to learn about disease Reviews kinases the fundamental regulators of most biological processes that have key roles in the development of all organisms Includes a broad scope of topics that are addressed Allows researchers and newcomers to this research area to gain a thorough picture of the current knowledge      *Computational Methods for Understanding Complexity: The Use of Formal Methods in Biology* David A. Rosenblueth,2016-11-21 The complexity of living organisms surpasses our unaided abilities of analysis Hence computational and mathematical methods are necessary for increasing our understanding of biological systems At the same time there has been a phenomenal recent progress allowing the application of novel formal methods to new domains This progress has spurred a conspicuous optimism in computational biology This optimism in turn has promoted a rapid increase in collaboration between specialists of biology with specialists of computer science Through sheer complexity however many important biological problems are at present intractable and it is not clear whether we will ever be able to solve such problems We are in the process of learning what kind of model and what kind of analysis and synthesis techniques to use for a particular problem Some existing formalisms have been readily used in biological problems others have been adapted to biological needs and still others have been especially developed for biological systems This Research Topic has examples of cases 1 employing existing methods 2 adapting methods to biology and 3 developing new methods We can also see discrete and Boolean models and the use of both simulators and model checkers Synthesis is exemplified by manual and by machine learning methods We hope that the articles collected in this Research Topic will stimulate new research      **Aging and Aging-Related Diseases** Zhao Wang,2018-09-19 This book provides an overview of recent advances in the study of aging and aging related diseases discussing the topics at individual organ tissue cell and molecular levels It also presents studies on the biomarkers of aging and anti aging interventions Aging has been becoming a global health problem However it was not possible to determine aging as we usually diagnose a disease because there are few biomarkers for age estimation Since ancient times people have been seeking anti aging substances and methods for achieving immortality while the scientific study of aging has only existed for 100 years This book appeals to researchers both in institutes and in pharmaceutical companies interested in further studies in this field
