

Full-Wave Rectifier Circuit

OBJECTIVES

At the end of this experiment, the learner should be able to:

1. Construct a basic full-wave rectifier circuit
2. Analyze the input and output waveform of a FWR circuit
3. Compute the parameters involved in a FWR circuit

BASIC INFORMATION

- Rectifiers are diodes used to change AC into DC. A diode works like a one-way switch, allowing current to flow in one direction only (unilateral).
- When AC is applied to a diode, the diode is forward biased for one half of the cycle and reverse-biased for the other half-cycle. The output waveform is a pulsating DC waveform.
- Rectifiers are widely used in power supplies to provide the DC voltage necessary for all active devices to work. The three basic rectifier circuits are the half-wave, the full-wave center tapped, and the bridge type full wave rectifier circuits.
- The **bridge rectifier** uses four diodes connected as shown in Figure 4–1. When the input cycle is positive as in part (a), diodes D_1 and D_2 are forward-biased and conduct current in the direction shown. A voltage is developed across R_L that looks like the positive half of the input cycle. During this time, diodes D_3 and D_4 are reverse-biased.
