General Information

Three mounts support the engine and transmission, holding a total of almost 1800 lb (814 kg). Two of the engine mounts support the rear of the engine and transmission assembly. The third supports the front of the engine.

The rear engine mounts, which are bolted to the inside of the frame rail near the flywheel housing, support legs that are bolted to the flywheel housing. Each mount is a one-piece assembly, with the elastomer isolator bonded to the metal bracket. The mounts are designed for longer life and reduced engine vibration. The engine leg fits into a flat recess in the mount. See Fig. 1.

The front engine mount is an underslung crossmember under the front of the engine. It supports a bracket that is bolted to the engine at each side of the vibration damper pulley. Upper and lower rubber

isolators reduce road shock to the front of the engine, and help isolate the vehicle frame from engine vibration. See Fig. 2.
