Handbook of Prescriptive Treatments for Adults

Robert T. Ammerman, Michel Hersen, 2013-11-11 This book could not have been conceptualized or published 20 years ago. Indeed, it is doubtful that we could have organized the material for this handbook 10 years ago. Over the last 20 years, however, the painstaking efforts of many clinical researchers working with a variety of resistive psychopathologies have resulted in specific psychotherapies and pharmacotherapies that are effective with a significant proportion of patients at least for some of the disorders. Much clinical research remains to be carried out in the forthcoming decades. But now that we are nearing the 21st century, at least some statement about efficacy can be made. In 1967, Gordon Paul succinctly stated that the ultimate goal of treatment outcome research is to determine "What treatment by whom is most effective for this individual with that specific problem and under which set of circumstances?" (p. 111). At that time, empirical evaluations of psychosocial and pharmacologic treatments were few and far between. Methodological strategies for determining treatment effectiveness were also in the formative stage, as exemplified by introduction of control groups that received inactive interventions, i.e., placebo, and the relatively recent practice of comparing two or more treatments in addition to placebo. In the almost three decades since Paul's oft-quoted dictum, both the quantity and the quality of treatment outcome research with adults have increased dramatically.

The Laboratory Mouse Hans Hedrich, 2004-08-21 Among animals used in research, teaching, and testing, mice are now widely recognized as the most important model for human diseases and disorders. They comprise the majority of all experimental mammals and tend to be the model of choice used for research into many diseases and disorders, including cancer, heart disease, asthma, Alzheimer's, Down syndrome, deafness, osteoporosis, obesity, diabetes, and even mental health research. Additionally, the laboratory mouse continues to play a widely publicized vital role in the human genome project. One of the most time-consuming activities in research laboratories is looking up information specific to the species or strain of animal being used. This book, part of the highly successful Handbook of Experimental Animals series, allows the user quick access to any point of interest on the mouse as an experimental model. Edited by Hans Hedrich, Hannover Medical School. Comprehensive reference source written by international experts. Well illustrated with high quality detailed images. Two color, user-friendly format combined with color plate sections.

The Handbook is unique in its focus on evidence-based practice and its attention to the most pressing question asked by students and practitioners: How do I do it?
