Mutations & Genetic Variation

Mutations: How Changes in DNA Affect Life

DNA holds the instructions for building living things. But sometimes, small changes happen to DNA. These changes are called **mutations**. Some mutations have no effect at all. Others can cause changes to proteins and things - for better, worse, or not at all.

What Causes Mutations?

Mutations can happen for several reasons:

- Mistakes during DNA replication (when a cell copies its DNA)
- Environmental factors, like UV radiation, chemicals, or viruses
- Spontaneous changes that happen naturally over time

Mutations can happen in any part of the DNA sequence.

Some affect just one base (called a **point mutation**), while others can insert or delete sections of DNA (insertion or deletion mutations).

Types of Mutations

- **Substitution (Point Mutation):** One base is swapped for another. Example: A-T becomes G-T.
- **Insertion:** One or more bases are added to the DNA sequence. Example: A new base slips into the middle of the sequence.
- **Deletion:** One or more bases are removed. Example: A missing base shifts the reading frame.

Some mutations change the proteins made by a gene. Others don't affect the protein at all, because of the redundancy in the genetic code.
