Law and Corporate Behaviour Christopher Hodges, 2015-10-22

This book examines the theories and practice of how to control corporate behaviour through legal techniques The principal theories examined are deterrence economic rational acting responsive regulation and the findings of behavioural psychology Leading examples of the various approaches are given in order to illustrate the models private enforcement of law through litigation in the USA public enforcement of competition law by the European Commission and the recent reform of policies on public enforcement of regulatory law in the United Kingdom Noting that behavioural psychology has as yet had only limited application in legal and regulatory theory the book then analyses various European regulatory structures where behavioural techniques can be seen or could be applied Sectors examined include financial services civil aviation pharmaceuticals and workplace health safety Key findings are that enforcement has to focus on identifying the causes of non compliance so as to be able to support improved performance rather than be based on fear motivating complete compliance Systems in which reporting is essential for safety only function with a no blame culture The book concludes by proposing an holistic model for maximising compliance within large organisations combining public regulatory and criminal controls with internal corporate systems and external influences by stakeholders held together by a unified core of ethical principles Hence the book proposes a new theory of ethical regulation This title is included in Bloomsbury Professional's International Arbitration online service

Neuro-motor control and feed-forward models of locomotion in humans Marco Iosa, Nadia Dominici, Federica

Tamburella, Leonardo Gizzi, 2015-07-29 Locomotion involves many different muscles and the need of controlling several degrees of freedom Despite the Central Nervous System can finely control the contraction of individual muscles emerging evidences indicate that strategies for the reduction of the complexity of movement and for compensating the sensorimotor delays may be adopted Experimental evidences in animal and lately human model led to the concept of a central pattern generator CPG which suggests that circuitry within the distal part of CNS i e spinal cord can generate the basic locomotor patterns even in the absence of sensory information Different studies pointed out the role of CPG in the control of locomotion as well as others investigated the neuroplasticity of CPG allowing for gait recovery after spinal cord lesion Literature was also focused on muscle synergies i e the combination of locomotor functional modules implemented in neuronal networks of the spinal cord generating specific motor output by imposing a specific timing structure and appropriate weightings to muscle activations Despite the great interest that this approach generated in the last years in the Scientific Community large areas of investigations remain available for further improvement e g the influence of afferent feedback and environmental constraints for both experimental and simulated models However also supraspinal structures are involved during locomotion and it has been shown that they are responsible for initiating and modifying the features of this basic rhythm for stabilising the upright walking and for coordinating movements in a dynamic changing environment Furthermore specific damages into spinal and supraspinal structures result in specific alterations of human locomotion as evident in subjects with brain injuries such as stroke brain trauma or people with cerebral palsy in people with death of dopaminergic neurons in the substantia nigra due to Parkinson s disease or in subjects with cerebellar dysfunctions such as patients with ataxia The role of cerebellum during locomotion has been shown to be related to coordination and adaptation of movements Cerebellum is the structure of CNS where are conceivably located the internal models that are neural representations miming meaningful aspects of our body such as input output characteristics of sensorimotor system Internal model control has been shown to be at the basis of motor strategies for compensating delays or lacks in sensorimotor feedbacks and some aspects of locomotion need predictive internal control especially for improving gait dynamic stability for avoiding obstacles or when sensory feedback is altered or lacking Furthermore despite internal model concepts are widespread in neuroscience and

neurocognitive science neurorehabilitation paid far too little attention to the potential role of internal model control on gait recovery Many important scientists have contributed to this Research Topic with original studies computational studies and review articles focused on neural circuits and internal models involved in the control of human locomotion aiming at understanding the role played in control of locomotion of different neural circuits located at brain cerebellum and spinal cord levels Vietnam Investment and Business Guide Volume 1 Strategic and Practical Information IBP, Inc.,2013-01-17

conditions are increasingly widespread requiring progressively more refined rehabilitation protocols based on scientific evidence. The deficits produced by these conditions can impair the nervous system, altering its functions and causing varying degrees of disability. Neurorehabilitation therefore involves the use of sophisticated diagnostic techniques and the application of protocols for functional rehabilitation of deficits aimed at reducing specific disabilities. *Handbook of Neurorehabilitation and Principles of Neurology* is split into four parts; parts one and two are more propaedeutic in nature and focus respectively on the neurobiological basis of neurorehabilitation and the general principles of motor and cognitive neurorehabilitation. Part three is devoted to the complex issues concerning the organization of services for patients. The final and by far the largest part covers all the neurological disorders requiring rehabilitative treatment. Each individual nosological category is presented by first considering the diagnostic criteria and then illustrating the most suitable rehabilitation protocols to obtain a reduction in deficits and disabilities. Written by specialists and aimed at all healthcare professionals working in biomedical institutions that provide neurological rehabilitation services, the book has the merit of outlining the state of the art and proposing evidence-based protocols supported by the latest research in the clinical and neuroscientific field. **Global**

Governance of Civil Aviation Safety Nilgun Ozgur, 2022-09-30. This book indicates the shortcomings of the current international legal system and customary international norms that govern international aviation law to comply with contemporary air transport market realities. As the air transport market develops globally, the safety regime of civil aviation should also be governed and applied globally. In this book, the author departs from current international legal norms to examine the emerging legal field of global administrative law. Through that lens, the possibility of reconstructing the set of legal mechanisms that govern domestic and international administrative interaction in the global field of aviation safety is explored. This book demonstrates that a legal system is never complete but always develops in tandem with changing needs, i.e., the participation of the affected parties. Exploring the principles of GAL theory contributes to addressing the contemporary legal issues relating to state compliance with international aviation safety standards that would otherwise not be covered by customary international law. In particular, the principles of GAL theory regarding global governance and the public character of global regulations, the role of individuals and states in global governance, and state sovereignty are considered valuable contributions to contemporary global aviation safety issues in practice. It is asserted in this book that proper checks and balances in global aviation safety can be improved by making these accessible to individuals by way of national courts. Finally, establishing public awareness of global aviation safety standards will eventually create greater pressure on states to implement and enforce them. This book is in an area increasing academic and research interest of practitioners of public international aviation law, global administrative law, global governance, and global aviation safety. global air transport market regulations **Rhythmic Patterns in Neuroscience and Human Physiology** Daniela De Bartolo, Marco Iosa, Giuseppe
