 Study Guide: The Periodic Table, Ions, and Valence Electrons
 1. Overview of the Periodic Table
 The periodic table is a systematic arrangement of elements based on their atomic number, electron configurations, and recurring chemical properties. Elements are organized into vertical columns (groups) and horizontal rows (periods). The periodic table is divided into three main categories: metals, non-metals, and metalloids (metals in between).
 2. Metals, Non-Metals, and Metalloids
 Metals are located on the left side of the periodic table. They are characterized by their lustrous appearance, high electrical and thermal conductivity, and malleability. Most metals are solid at room temperature, except for mercury (Hg), which is a liquid.
 Non-metals are located on the right side of the periodic table. They are characterized by their lack of luster, low electrical and thermal conductivity, and brittleness. Most non-metals are gases at room temperature, except for carbon (C), silicon (Si), and boron (B), which are solids.
 Metalloids are located between the metals and non-metals. They have properties that are intermediate between metals and non-metals. Examples of metalloids include boron (B), silicon (Si), germanium (Ge), arsenic (As), antimony (Sb), tellurium (Te), and polonium (Po).
 3. Groups and Periods
 Groups are vertical columns of elements that share similar chemical properties. There are 18 groups in the periodic table. Periods are horizontal rows of elements. There are 7 periods in the periodic table. Elements in the same group have the same number of valence electrons, which determines their chemical behavior. Elements in the same period have the same number of electron shells, which determines their atomic size.
