halophytes are highly specialized plants which have greater tolerance to salt They can germinate grow and reproduce
successfully in saline areas which would cause the death of regular plants Most halophytic species are found in salt marsh
systems along seashores or around landlocked inland lakes and flat plains with high evaporation The halophytes play very
significant role in the saline areas specially in the coast by overcoming the salinity in different ways viz with regulating
mechanisms in which excess salts are excreted and with out regulating mechanism which may include succulents or
cumulative types Besides that they protect coast from erosion and cyclones provide feeding ground and nursery for fish
shrimps and birds Halophytes get increasing attention today because of the steady increase of the salinity in irrigation
systems in the arid and semi arid regions where the increasing population reaches the limits of freshwater availability In
many countries halophytes have been successfully grown on saline wasteland to provide animal fodder and have the potential
for rehabilitation and even reclamation of these sites The value of certain salt tolerant grass species has been recognized by
their incorporation in pasture improvement programs in many salt affected regions throughout the world There have been
recent advances in selecting species with high biomass and protein levels in combination with their ability to survive a wide
range of environmental conditions including salinity The Athenaeum ,1891 The Publishers Weekly ,1888 **The**
