Research stimulated by curiosity brings out new pieces that make up the puzzle of life and invention provides the tools to assemble and interpret it. The Industrial Revolution of past centuries has brought innovations not accompanied by a farsighted vision of the consequences that are manifesting in this globalized twenty-first century particularly with an increase in energy demand and global warming. The emerging biotechnology revolution which applies technology to biological systems could solve these problems without further deleterious effects if driven by sustainable development. Research and development institutes subsidized by governments are looking for renewable and sustainable energy resources that would replace polluting fossil fuels nearly depleted. Recently the investigation of the marine microalgae's potential in biotechnological applications is increasing by the realization that the ocean is a relatively untapped source of energy, biomass and novel biomolecules. Microalgae mainly represent the last generation suitable feedstock for the transport sector but due to their biochemical versatility are useful also for many other industrial fields such as medical, pharmaceutical, food and cosmetic. Nowadays biofuel production from microalgae biomass is still in progress; the efficiency of each step during the whole process from culturing to refining needs to be improved to get yield economically reasonable. Coupling each other different industrial applications could lead to overcome the substantial investments with proper earnings making hopefully in the next future this living energy source lucrative therefore commercially feasible. In the last decades researchers are focusing their attention on Diatoms, a taxon of microalgae characterized by silica walls derived from secondary symbiotic event. Diatoms are affected by seasonal exponential growth called blooms that place them at the base of the oceans food chain; permit about 40% of atmospheric CO₂ fixation and significant influence the biogeochemical cycle of the macronutrients silicon (Si), nitrogen (N), phosphorus (P). This microalgae's group is a promising candidate for biodiesel production because of their great lipid accumulation like reserve storage compound mainly in the form of triacylglycerols (TAG) converted into biodiesel through a reaction of trans esterification. The aim of this thesis was the evaluation of the growth curves and biochemical composition (lipids, carbohydrates and proteins) of the marine diatom *Cyclotella cryptica* grown in batch system by administering the average of the standard medium f/2 daily or only the day of the inoculation. The growth curve was obtained by monitoring daily the cellular density (cells/mL) with an optical microscope combined with a Barker chamber. The biological macromolecules quantification (lipids, carbohydrates and proteins) were realized by Folch, modified MTBE, Dubois and Lowry methods respectively. Furthermore the lipids composition was characterized both by Thin Layer Chromatography (TLC) and Nuclear Magnetic Resonance (NMR) ERETIC method. The results show that the daily supply of the medium f/2 induce high cell density (2250000 ± 77567 cells/mL) and biomass dry weight (1441.79 ± 148.35 mg/L) that mainly consist of proteins (88%) and lipid fraction is predominantly composed by phospholipids (PL). Conversely administering the medium f/2 only the first day let the diatoms in a starvation condition defined by a little cell density (192222 ± 26851) and biomass dry weight (205.90 ± 22.24 mg/L) with a

significant increase in the relative amount of storage compounds carbohydrates 19% and lipid 33% predominantly in form of triacylglycerols TAG Typically microalgae are grown at first in laboratories under strict controlled condition in closed photobioreactors and then transferred to open ponds for large scale production

Natural Polymers and Biopolymers II

Sylvain Caillol, 2021-05-05 BioPolymers could be either natural polymers polymer naturally occurring in Nature such as cellulose or starch or biobased polymers that are artificially synthesized from natural resources Since the late 1990s the polymer industry has faced two serious problems global warming and anticipation of limitation to the access to fossil resources One solution consists in the use of sustainable resources instead of fossil based resources Hence biomass feedstocks are a promising resource and biopolymers are one of the most dynamic polymer area Additionally biodegradability is a special functionality conferred to a material bio based or not Very recently facing the awareness of the volumes of plastic wastes biodegradable polymers are gaining increasing attention from the market and industrial community This special issue of *Molecules* deals with the current scientific and industrial challenges of Natural and Biobased Polymers through the access of new biobased monomers improved thermo mechanical properties and by substitution of harmful substances This themed issue can be considered as collection of highlights within the field of Natural Polymers and Biobased Polymers which clearly demonstrate the increased interest in this field We hope that this will inspire researchers to further develop this area and thus contribute to future more sustainable society
