Therefore, by definition,  $\lim_{n \rightarrow \infty} \frac{1}{n} \log \frac{1}{n} = 0$ . Therefore, the asymptotic rate of communication is bounded by  $\frac{1}{n} \log \frac{1}{n}$ . A constant rate of bits received per symbol is not possible as the rate of bits received per symbol is  $\frac{1}{n} \log \frac{1}{n}$ . Therefore, the asymptotic rate of a code of length  $n$  is bounded by  $\frac{1}{n} \log \frac{1}{n}$ . Since the rate of bits received per symbol is  $\frac{1}{n} \log \frac{1}{n}$ , it has a logarithmic relationship to the asymptotic rate of bits.

Markusen, 2010

The basic gains from trade theorem makes a stark comparison between completely free trade and complete autarky. This paper is motivated by recent evidence that trade has greatly expanded on the extensive margin aka fragmentation offshoring by adding newly traded goods and services and that much of this new trade is in intermediates. I provide an extension of existing gains from trade results by allowing trade in an added set of final and/or intermediate goods. As seems generally understood, a sufficient condition for all countries to gain from fragmentation is that the relative world prices of initially traded goods don't change. However, trade costs break the strict link between domestic and world prices in my approach, and this results in interesting subtleties as initially traded goods change their trade status following fragmentation. I illustrate these results by applying them to two recent and quite specific formulations of expansion at the extensive margin: Grossman and Rossi-Hansberg 2008 and Markusen and Venables 2007. Symmetry in two senses results in gains for all countries: countries are relatively symmetric in size and the newly traded goods are relatively symmetric in their factor intensities with respect to the world endowment ratio.
