Genetics Joins Evolutionary Theory

Gregor Mendel's original ideas on how hereditary information is passed:

- 1. Hereditary information that forms an individual is controlled by genes and that genes are passed on from one generation to the next. The combination of different alleles in an individual determines the individual's characteristics.
- 2. Genes are passed on from one generation to the next in a predictable manner. Alleles of a particular gene in a population group of genes, called a gene pool.
- 3. **Allele frequency**: is the number of copies of an allele in a gene pool. Allele frequency is the number of copies of an allele in a population. Allele frequency is the number of copies of an allele in a population. Allele frequency is the number of copies of an allele in a population.

Examples of Mendel's "hereditary" factors Mendel's work on pea plants showed that genes are passed on from one generation to the next. Mendel's work on pea plants showed that genes are passed on from one generation to the next. Mendel's work on pea plants showed that genes are passed on from one generation to the next.
