

The Digestive System

What is the digestive system?

The digestive system, or **gastrointestinal tract**, is a tract of organs that is responsible for digesting and absorbing nutrients from food. Food enters through the mouth, is broken down in the stomach, and then moves through the small intestine, where nutrients are absorbed. The digestive system also includes accessory organs that help in the process, such as the liver, pancreas, and gallbladder.

Liver, pancreas & gallbladder

Just below the stomach, organs known as the **accessories** of the digestive system, which are connected to the gastrointestinal tract by the **pancreatic duct**, are located. The **pancreas**, this organ is a fleshy organ in the retroperitoneum. The **gallbladder** is a pear-shaped sac that stores bile. The **liver** is the largest organ in the body and is located in the upper right quadrant of the abdomen.

Large intestine
The large intestine consists of the cecum, the ascending colon, the transverse colon, the descending colon, the sigmoid colon, and the rectum. It is responsible for absorbing water and electrolytes from the undigested food and forming feces.

Peristaltic action
Food material is pushed through the digestive system by a series of powerful muscular contractions called peristalsis. These contractions are initiated by the nervous system and the digestive system itself. The digestive system also has a reflex action, which is known as the peristaltic reflex.

The mouth & salivary glands

Chewing, the mechanical action of the food, is carried out by the teeth. The salivary glands, which are located in the mouth, produce saliva, which is used to moisten the food and to begin the digestion of carbohydrates. The salivary glands are the **parotid gland**, the **sublingual gland**, and the **submandibular gland**.

The stomach

The stomach is a muscular organ that is responsible for the digestion of food. It is located in the upper left quadrant of the abdomen. The stomach wall is composed of four layers: the **mucosa**, the **submucosa**, the **muscularis**, and the **serosa**.

Small intestine

The small intestine consists of three parts: the **duodenum**, the **jejunum**, and the **ileum**. It is responsible for the digestion of food and the absorption of nutrients. The small intestine is highly coiled and has a large surface area for absorption.

Absorption

The process of absorption is the process by which nutrients are taken up by the body. It occurs in the small intestine, where the nutrients are absorbed into the bloodstream. The process of absorption is highly efficient and ensures that the body receives all the nutrients it needs.
