

consists of numeric and symbolic features and it is converted in numeric form so that it can be given as inputs to required neural network. Now this modified data set is ready to be used as training and testing of the neural network.

3) Determining the NN architecture

There is no certain mathematical approach for obtaining the optimum number of hidden layers and their neurons. For choosing optimum set of hidden layers and its no. of neuron a comparison is made for many cases and optimum is selected.

III. FDPM MARKING SCHEME

A. The Encoding Procedure

Before the FDPM mark can be generated, the length of the mark must be determined based on the network protocols deployed within the network to be protected. According to different situations, the mark length could be 24 bits long at most, 19 bits at middle, and 16 bits at least[8][9].

Fig. 3: FDPM encoding procedure

B. The Reconstruction Procedure

Mark recognition and Address recovery are the two main steps of the reconstruction procedure. The mark recognition step is the reverse process of the encoding process. By reading the control fields in the mark, the length of the mark and which fields in the IP header store the mark can be recognized. If the RF is 0, the mark length is 24 (both TOS and ID are deployed). If the RF is 1, according to different protocols of TOS used, the mark length is 16 or 19. The second step, address recovery, analyzes the mark and stores it in a recovery table. It is a linked-list table; the number of rows is a variable, and the number of columns in the table is k , representing the number of segments used to carry the source address in the packets. Here, the segment number is used to correlate the data into the correct order. The row of the table means the entry and each digest owns one entry (source IP address).

Fig. 4: FDPM reconstruction scheme

Fig. 4 shows the reconstruction scheme. When all fields in one entry are filled according to the segment number, this source IP address is reconstructed and the entry in the recovery table is then deleted.

IV. RESULT AND DISCUSSION

A. Training and Testing

The result of the Cloud Protector shown in Fig. 5(a, b) demonstrates that on its training sets it detected around 91% of with a miss rating of 9%. Also, against the test dataset, the results slightly varied down by 3% (88% of attack traffic).
