

## OPERATING SYSTEM

The operating system resides in an EPROM (Erasable Programmable Read Only Memory). The system's functional program, which is defined by the user, is stored in an EEPROM (Electrically Erasable And Programmable Read Only Memory), and may be programmed by either front panel switches or via a uniquely "User Friendly" computer program. Both forms of storage are non-volatile.

The system features a 500-event History Log.

## SYSTEM CONTROL UNIT

The main System Control Unit (SCU) serves as a basic information and control center for standard operator functions.

A self-contained Programming Diagnostic Center with a two-digit, 7-segment LED digital display provides system operation, programming and internal troubleshooting features. An RS-232 port provides supervised output to a remote printer or video terminal.

The power supply contains a dual rate charger. The transformerless Switching Power Supply Unit (SPSU/V) can maintain sealed lead-acid batteries up to 55 amp/hr capacity.

## AUXILIARY DEGRADE ALARM CIRCUIT (ADAC<sup>SM</sup>)

The T200 Series control features Auxiliary Degrade Alarm Circuit (ADAC®) degrade operation. In the event of main processor failure, the "DEGRADE" LED will light. In the event an alarm is received, each subordinate processor is capable of operating a general alarm program.

In the event of multiple or all processor failure, the ADAC<sup>SM</sup> mode will operate the system in a general alarm configuration.

## ALARM VERIFICATION

The Alarm Verification feature is programmable for all smoke sensors, analog or conventional. This allows smoke sensors that are installed in environments prone to nuisance or unwanted alarms to operate as follows: In the event the sensor alarms, a distinctive alarm verification message will be displayed for 25 seconds. The circuit or device will then automatically reset. The system will then remain in the verification mode for a period of approximately 85 seconds. If the sensor or any other sensor on the same circuit alarms within this period, a system alarm will occur. If no alarm occurs within this period, the system will return to normal condition.

## WALK TEST

The Walk Test feature is performed on a signaling line circuit, on zone basis and enables testing of the system by a single individual. During this test, the act of placing a device in alarm will cause four pulses on the verification appliance circuits, operation of a supervisory switch will cause three pulses, while removal or disconnection of an initiating device will cause two pulses. The events will be recorded on a printer, if one is installed.

## SELECTIVE ALARM SOUNDING

The notification appliance circuits on the SCU, DSU and DLU units can be individually programmed to activate on alarm, trouble, or supervisory signal from a specific addressable module/sensor, hardwired zone or noise, and sound non-code, temporal pattern, march time or fixed-code signals. Cross-zoning and "Ring by Zone" operation are readily accomplished.
