Genes and Variation

Genetic Variation Genes determine the characteristics of organisms and explain both why we are different from one another and why organisms are similar within the same species.

Genotype and Phenotype Genotype

a) Genotype: **experiments that tested and not those offspring as well**

a) Phenotype: **concluded that some parents that were having same trait**

conclude that: **every allele will come for a population**

It's genetic inheritance: **the number of alleles of a gene in an organism**

a) Genotype vs. Phenotype: **genotype is the set of all genes and phenotype is the physical characteristics of an organism**

Genetic inheritance Genotype

a) Inheritance: **passed on from parents to offspring, which is then passed on to the next generation**

a) Genotype and Phenotype: **the number of alleles of a gene in an organism**

a) Genotype and Phenotype: **the number of alleles of a gene in an organism**

Lesson Summary

Genetics and Evolutionary Theory

- Genetic variation is the difference in the DNA sequence between individuals of a population.

- Genetic variation is the difference in the DNA sequence between individuals of a population. It is the raw material for natural selection, which is the process by which certain traits are passed on to the next generation. Genetic variation can be caused by mutations, which are changes in the DNA sequence, or by recombination, which is the process by which genetic material is shuffled during meiosis. Genetic variation is essential for the survival of a population in a changing environment, as it allows the population to adapt to new conditions.

Conservation Genetics V. Loeschcke, J. Tomiuk, S.K. Jain, 2013-03-11 It follows naturally from the widely accepted Darwinian dictum that failures of populations or of species to adapt and to evolve under changing environments will result in their extinction Population geneticists have proclaimed a centerstage role in developing conservation biology theory and applications However we must critically reexamine what we know and how we can make rational contributions We ask Is genetic variation really important for the persistence of species Has any species become extinct because it ran out of genetic variation or because of inbreeding depression Are demographic and environmental stochasticity by far more important for the fate of a population or species than genetic stochasticity genetic drift and inbreeding Is there more to genetics than being a tool for assessing reproductive units and migration rates Does conventional wisdom on inbreeding and magic numbers or rules of thumb on critical effective population sizes MVP estimators reflect any useful guidelines in conservation biology What messages or guidelines from genetics can we reliably provide to those that work with conservation in practice Is empirical work on numerous threatened habitats and taxa gathering population genetic information that we can use to test these guidelines These and other questions were raised in the invitation to a symposium on conservation genetics held in May 1993 in pleasant surroundings at an old manor house in southern Jutland Denmark *Transmission and Population Genetics* Benjamin A.
