Crop Resistance Mechanisms to Alleviate Climate Change-Related Stress Jose Ramon Acosta Motos, Juan De Dios Franco-Navarro, Sara Álvarez, María José Gómez-Bellot, 2024-02-20 Anthropogenic activities have aggravated the effects of global climate change on ecosystems. Plants, because of their inability to escape from an adverse environment, suffer to a great extent from stresses which can negatively impact their growth and development. Global warming is increasingly causing extreme climatic situations such as very high or low temperatures, drought and flooding events, hailstorms, wildfires, extreme precipitation events, and the reduction of fertile soil through desertification and salinization. In addition, warmer temperatures and higher humidity related with the climate change can also increase pest and disease pressure on plants by altering the geographic range, population size, and timing of pest and disease outbreaks. Taken together, abiotic stress related with climate change, as drought or extreme temperature, can exacerbate the spread and severity of various diseases associated with biotic stress, increasing the vulnerability of plants to pathogens. Some examples include insects, fungi, bacteria, or viruses.

Written for the highly successful *Methods in Molecular Biology* series, chapters include introductions to their respective topics, lists of the necessary materials and reagents, step by step and readily reproducible laboratory protocols, and tips on troubleshooting and avoiding known pitfalls. Authoritative and practical, *Microbial Steroids: Methods and Protocols, Second Edition* serves as an ideal reference source for laboratory and industrial professionals, as well as for students in a wide array of biological disciplines.
