

time required to compute an  $H_1$  controller for each value of the blending factor  $\beta$ .

The three controllers achieve closed-loop  $H_2$  norms of 0.04, 0.07 and 0.03, respectively. Computed closed-loop modes and compare the gains from road disturbance to  $y_1, y_2, y_3$  for the passive and active systems. Note that all three controllers reduce suspension deflection and body acceleration below the set points.

### Abstract

So far you have designed  $\hat{X}_n$  controllers that meet the performance objectives for the nominal value (nominal) system. This model is only an approximation of the true situation and you need to make sure performance is maintained in the face of model errors and uncertainties. This is called robust performance. Next you will synthesize design  $\mu$  controllers that achieve robust performance for the entire family of  $\mu$  system controllers (synthesized with the design function using the structured model errors)  $\{ \hat{X}_n \}$  or “worst-case” performance ( $\mu = 0.1$ ).
