

Definition: Angle

An **angle** is a figure formed by two rays with a common endpoint. The common endpoint is called the **vertex of the angle**, and the rays are the **sides of the angle**.

An angle divides a plane into two regions: the **interior** and the **exterior** of the angle. If two points, one from each side of an angle, are connected by a segment, the segment passes through the interior of the angle.

1.1.3

An angle can be named with the angle symbol ($\angle$) and three letters: one point from each side of the angle plus the vertex, with the letter for the vertex in the middle. If there is only one angle with a given vertex, the angle can be named with the angle symbol and the single letter that represents the vertex. Angles can also be named with a number shown in the angle's interior.

EXAMPLE

Name each figure.

Intersections of Geometric Figures

When geometric figures have one or more points in common, they are said to **intersect**. The set of points that they have in common is called their **intersection**. In the Activity that follows, you will discover some fundamental geometry ideas, or **postulates**, involving intersections of geometric figures. Postulates are statements that are accepted as true without proof. Postulates, like undefined terms, are building blocks of geometry. (Postulates are also known as **axioms**.)
