

Lab 53: Fertilization and Early Development

Introduction

Fertilization is the process by which the nuclei of an egg and a sperm cell fuse together to form a new cell, the zygote. This process is essential for the development of a new organism.

In sexually reproducing organisms, the egg and sperm cells are produced by meiosis, a process that results in the formation of four haploid cells from a single diploid cell. These cells are then fertilized to form a diploid zygote. The zygote then undergoes cleavage, a series of cell divisions that result in the formation of a blastocyst, which is the early stage of development.

During the fertilization process, the egg and sperm cells fuse to form a zygote. The zygote then undergoes cleavage, a series of cell divisions that result in the formation of a blastocyst, which is the early stage of development. The blastocyst then implants itself in the uterine wall, where it will continue to develop into a fetus.

Purpose

The purpose of this lab is to observe the process of fertilization and to observe the early stages of development.

Objectives

1. Observe the process of fertilization.
2. Observe the early stages of development.
