

Internal Structure of the Heart
Lecture 1: The Heart and its Function

The heart is a muscular organ that pumps blood throughout the body. It is composed of four chambers: the right and left atria and ventricles. The right atrium receives deoxygenated blood from the body, and the right ventricle pumps it to the lungs. The left atrium receives oxygenated blood from the lungs, and the left ventricle pumps it to the rest of the body. The heart is surrounded by a double-walled sac called the pericardium, which contains a lubricating fluid to reduce friction. The heart is also connected to a network of blood vessels called the coronary arteries, which supply the heart with oxygenated blood. The heart is a complex organ with a highly organized internal structure. The four chambers are separated by thick, muscular walls. The right atrium and ventricle are connected by the tricuspid valve, and the left atrium and ventricle are connected by the mitral valve. The ventricles are further divided into smaller chambers called the papillary muscles, which help to pump blood out of the heart. The heart is a vital organ that keeps the body's blood flowing, and its internal structure is essential for its function.
