*Modern Compiler Design* Dick Grune, Kees van Reeuwijk, Henri E. Bal, Criel J.H. Jacobs, Koen Langendoen, 2012-07-20  
Modern Compiler Design makes the topic of compiler design more accessible by focusing on principles and techniques of wide application. By carefully distinguishing between the essential material that has a high chance of being useful and the incidental material that will be of benefit only in exceptional cases, much useful information was packed in this comprehensive volume. The student who has finished this book can expect to understand the workings of and add to a language processor for each of the modern paradigms and be able to read the literature on how to proceed. The first provides a firm basis, the second potential for growth. Computer Aided Systems Theory - EUROCAST 2007 Roberto Moreno Díaz, Franz Pichler, Alexis Quesada Arencibia, 2007-11-16 This book constitutes the thoroughly refereed post proceedings of the 11th International Conference on Computer Aided Systems Theory EUROCAST 2007. Coverage in the 144 revised full papers presented includes formal approaches, computation and simulation in modeling biological systems, intelligent information processing, heuristic problem solving, signal processing, architectures, robotics and robotic soccer, cybercars and intelligent vehicles and artificial intelligence components. OpenMP: Portable Multi-Level Parallelism on Modern Systems Kent Milfeld, Bronis R. de Supinski, Lars Koesterke, Jannis Klinkenberg, 2020-09-01 This book constitutes the proceedings of the 16th International Workshop on OpenMP IWOMP 2020 held in Austin TX USA in September 2020. The conference was held virtually due to the COVID 19 pandemic. The 21 full papers presented in this volume were carefully reviewed and selected for inclusion in this book. The papers are organized in topical sections named performance, methodologies, applications, OpenMP extensions, performance studies, tools, NUMA, compilation techniques, heterogeneous computing and memory. Today's society is increasingly software driven and dependent on powerful computer technology. Therefore it is important

that advancements in the low level processor hardware are made available for exploitation by a growing number of programmers of differing skill level However as we are approaching the end of Moore s law hardware designers are finding new and increasingly complex ways to increase the accessible processor performance It is getting more and more difficult to effectively target these processing resources without expert knowledge in parallelization heterogeneous computation communication synchronization and so on To ensure that the software side can keep up advanced programming environments and frameworks are needed to bridge the widening gap between hardware and software One such example is the pattern centric skeleton programming model and in particular the SkePU project The work presented in this thesis first redesigns the SkePU framework based on modern C variadic template metaprogramming and state of the art compiler technology It then explores new ways to improve performance by providing new patterns improving the data access locality of existing ones and using both static and dynamic knowledge about program flow The work combines novel ideas with practical evaluation of the approach on several applications The advancements also include the first skeleton API that allows variadic skeletons new data containers and finally an approach to make skeleton programming more customizable without compromising universal portability
