*Mathematical Models for Poroelastic Flows* Anvarbek Meirmanov, 2013-11-29 The book is devoted to rigorous derivation of macroscopic mathematical models as a homogenization of exact mathematical models at the microscopic level The idea is quite natural one first must describe the joint motion of the elastic skeleton and the fluid in pores at the microscopic level by means of classical continuum mechanics and then use homogenization to find appropriate approximation models homogenized equations The Navier Stokes equations still hold at this scale of the pore size in the order of 5-15 microns Thus as we have mentioned above the macroscopic mathematical models obtained are still within the limits of physical applicability These mathematical models describe different physical processes of liquid filtration and acoustics in poroelastic media such as isothermal or non isothermal filtration hydraulic shock isothermal or non isothermal acoustics diffusion convection filtration and acoustics in composite media or in porous fractured reservoirs Our research is based upon the Nguetseng two scale convergent method

*Advanced Differential Equations* Youssef N. Raffoul, 2022-04-13 Advanced Differential Equations provides coverage of

Afoukal,Brahim Es-sebbar,Khalil Ezzinbi,Gaston Mandata N'Guérékata,2025-03-03 When we study differential equations in Banach spaces whose coefficients are linear unbounded operators we feel that we are working in ordinary differential equations however the fact that the operator coefficients are unbounded makes things quite different from what is known in the classical case Examples or applications for such equations are naturally found in the theory of partial differential equations More specifically if we give importance to the time variable at the expense of the spatial variables we obtain an ordinary differential equation with respect to the variable which was put in evidence Thus for example the heat or the wave equation gives rise to ordinary differential equations of this kind Adding boundary conditions can often be translated in terms of considering solutions in some convenient functional Banach space The theory of semigroups of operators provides an elegant approach to study this kind of systems Therefore we can frequently guess or even prove theorems on differential equations in Banach spaces looking at a corresponding pattern in finite dimensional ordinary differential equations

*Nonautonomous Dynamical Systems* Peter E. Kloeden,Martin Rasmussen,2011-08-17 The theory of nonautonomous dynamical systems in both of its formulations as processes and skew product flows is developed systematically in this book The focus is on dissipative systems and nonautonomous attractors in particular the recently introduced concept of pullback attractors Linearization theory invariant manifolds Lyapunov functions Morse decompositions and bifurcations for nonautonomous systems and set valued generalizations are also considered as well as applications to numerical approximations switching systems and synchronization Parallels with corresponding theories of control and random dynamical systems are briefly sketched With its clear and systematic exposition many examples and exercises as well as its
