Practical Handbook of Neurosurgery Marc Sindou, 2009-11-06 Practical Handbook of Neurosurgery invites readers to take part in a journey through the vast field of neurosurgery in the company of internationally renowned experts At a time when the discipline is experiencing a detrimental tendency to segment into various subfields and scatter in the process it can be worthwhile to collect a number of practical lessons gleaned from experienced and leading neurosurgeons The book also aims to present numerous important figures in the neurosurgical community with a brief overview of the vitae and main contributions for each We must confess that we were sad that some of the most active members were unable to participate likely due to time constraints We are however fortunate that the majority were able to take part As such though not exhaustive the book does represent an anthology of contemporary neurosurgeons From the preface At the very beginning of the project our intention was to make a poetbook But month after month it became obvious that the work would be much more expansive ultimately we produced three volumes Nevertheless we hope that all the three volumes together will remain easily accessible and a daily companion The pocket has to be more like a travel bag We would like to thank all of the contributors they have sacrificed their valuable time to deliver sound and critical views and above all useful guidelines

Greenberg,2023-04-19 The fundamental one stop global resource for neurosurgical practice in updated 10th edition Unlike traditional medical textbooks the origins of the now legendary Handbook of Neurosurgery by Mark Greenberg took root in the late 1980 s in the notes the author kept while taking care of his patients from his weekly grand rounds presentations and in the literature he read Now in its 10th edition the book that is often referred to as the bible for neurosurgeons has grown organically over the years to include more topics of importance to those who provide healthcare to patients with neurologic ailments and to reflect advances in the understanding and management of the underlying conditions and diseases Throughout 23 sections and 116 chapters the generously illustrated text covers information ranging from pediatrics to geriatrics The comprehensive conveniently compact book provides detailed high value and actionable information that can be quickly accessed to enhance patient management thereby eliminating the need to wade through superfluous material It is also a perfect study companion for board examination and preparation for the maintenance of certification Key Features Updated classification and diagnostic criteria of central and peripheral nervous system tumors based on the most recent WHO classifications Reworking of numerous sections including current concepts in pseudotumor cerebri seizure classification and more Addition of new chapters including idiopathic scoliosis LOVA and tuberculosis of the CNS Current principles of nonsurgical and surgical management including risk factors indications diagnostics prognoses contraindications and differential diagnoses Nearly 500 figures including new summary flow charts illustrations and simplified diagrams for early learners enhance understanding of material discussed in the text As in prior editions thousands of references for further study This unique book encompasses a wide breadth of neurosurgical topics in an easy digestible format making it an indispensable daily reference for all neurosurgical residents fellows neurosurgeons and allied health practitioners This print book includes a scratch off code to access a complimentary digital copy on MedOne Publisher s Note Products purchased from Third Party sellers are not guaranteed by the publisher for quality authenticity or access to any online entitlements included with the product *Understanding and Managing Thrombotic Risks in Medical Conditions* Menikae Kanchena Heenkenda,2024-08-20 Hemostasis is a critical physiological process that stops bleeding at the site of an injury while ensuring normal blood flow elsewhere thereby preventing excessive clot formation that could lead to dangerous conditions like thrombosis This delicate balance is influenced by genetics medical conditions such as cancer and various medications When a blood vessel is damaged platelets adhere to the exposed area become activated and aggregate to form an initial plug Coagulation factors particularly thrombin create a strong fibrin network to stabilize the clot Disruptions in this process can

result in significant bleeding or dangerous clot formation This thesis aims to explore and understand the factors affecting coagulation and the risks of thrombotic events in different medical contexts This includes studying genetic variability in the protease activated receptor 4 PAR4 gene specifically the Ala120Thr variant among sub Saharan African populations identifying genetic and non genetic risk factors for venous thromboembolism VTE in patients with the brain cancer glioblastoma multiforme GBM and investigating the impact of intravenous morphine on platelet activity in patients with ST elevation myocardial infarction STEMI treated with ticagrelor a P2Y12 inhibitor The A allele of the rs773902 single nucleotide polymorphism SNP in the PAR4 gene F2RL3 substitutes threonine for alanine at the 120th protein position Thr120 This allele is more prevalent in African populations compared to Caucasian populations although previous studies did not specify the geographic ancestry of participants Thr120 is associated with higher PAR4 induced human platelet aggregation and Ca²⁺ flux Our study found that the frequency of the A allele in the Somali population is significantly lower than previously reported for African Americans The A allele frequency in Somalis is 38% compared to 63% for African Americans The A allele frequency in Somalis is closer to that of the Maasai population in Kenya 41% but vastly different from the Esan population in Nigeria 68% Certain cancers such as GBM are associated with a higher risk of VTE including deep vein thrombosis DVT and pulmonary embolism PE Our research identified blood group B as a significant risk factor for patients with GBM OR 6.91 95% CI 2.2-24.1 P 0.001 Also GBM tumors in the frontal lobe are associated with an increased risk of VTE OR 3.14 95% CI 1.1-10.7 P 0.05 Our study on morphine commonly used for pain management in STEMI patients found that morphine is associated with increased platelet aggregation one hour after percutaneous coronary intervention PCI impacting the efficacy of ticagrelor Morphine delays platelet inhibition by affecting the pharmacodynamics of antiplatelet therapy likely by delaying gastric emptying However this effect is short lived as platelet reactivity returns to similar levels in both groups 12 hours post PCI Despite this immediate impact on platelet function our research found no significant differences in biomarkers of platelet activity coagulation or inflammation between the morphine and non morphine groups Additionally all patients in our study were administered unfractionated heparin injections or bivalirudin infusion during primary PCI which may help control the risk of blood clot formation These studies collectively emphasize the need for individualized strategies to manage thrombotic risks and coagulation The significant genetic variability among sub Saharan African populations highlights the need for precise genetic research to understand how genetics influence coagulation and develop personalized medical strategies The increased risk of cancer associated thrombosis particularly in patients with GBM calls for individualized anticoagulant therapies based on unique risk profiles such as blood group typing and tumor location Incorporating these insights into clinical practice can help healthcare providers better identify high risk patients and tailor thromboprophylaxis strategies accordingly Similarly the impact of morphine on patients with STEMI treated with ticagrelor requires careful consideration In conclusion these findings underscore the importance of a personalized approach in managing coagulation and thrombotic

risks The studies show that genetic variability specific medical conditions and medication effects are crucial in thrombotic risk Therefore customized strategies based on individual patient profiles and contexts are essential for effectively managing and preventing thrombotic events
