Emerging Solutions for Future Manufacturing Systems Luis M. Camarinha-Matos, 2006-01-04 Industries and

particularly the manufacturing sector have been facing difficult challenges in a context of socio economic turbulence characterized by complexity as well as the speed of change in causal interconnections in the socio economic environment In order to respond to these challenges companies are forced to seek new technological and organizational solutions In this context two main characteristics emerge as key properties of a modern automation system agility and distribution Agility because systems need not only to be flexible in order to adjust to a number of a priori defined scenarios but rather must cope with unpredictability Distribution in the sense that automation and business processes are becoming distributed and supported by collaborative networks Emerging Solutions for Future Manufacturing Systems includes the papers selected for the BASYS 04 conference which was held in Vienna Austria in September 2004 and sponsored by the International Federation for Information Processing IFIP

Proceedings of the 9th Workshop on Aspects, Components, and Patterns for Infrastructure Software (ACP4IS '10) Bram Adams, Michael Haupt, Daniel Lohmann, 2010 Aspect oriented programming component models and design patterns are modern and actively evolving techniques for improving the modularization of complex software In particular these techniques hold great promise for the development of systems infrastructure software e g application servers middleware virtual machines compilers operating systems and other software that provides general services for higher level applications The developers of infrastructure software are faced with increasing demands from application programmers needing higher level support for application development Meeting these demands requires careful use of software modularization techniques since infrastructural concerns are notoriously hard to modularize Aspects components and patterns provide very different means to deal with infrastructure software but despite their differences they have much in common For instance component models try to free the developer from the need to deal directly with services like security or transactions These are primary examples of crosscutting concerns and modularizing such concerns are the main target of aspect oriented languages Similarly design patterns like Visitor and Interceptor facilitate the clean modularization of otherwise tangled concerns Building on the ACP4IS

meetings at AOSD 2002 2009 this workshop aims to provide a highly interactive forum for researchers and developers to discuss the application of and relationships between aspects components and patterns within modern infrastructure software The goal is to put aspects components and patterns into a common reference frame and to build connections between the software engineering and systems communities
