The Algorithmic Beauty of Plants Przemyslaw Prusinkiewicz, Aristid Lindenmayer, 2012-12-06 The beauty of plants has attracted the attention of mathematicians for Mathematics centuries Conspicuous geometric features such as the bilateral sym and beauty metry of leaves the rotational symmetry of flowers and the helical arrangements of scales in pine cones have been studied most extensively This focus is reflected in a quotation from Weyl 159 page 3 Beauty is bound up with symmetry This book explores two other factors that organize plant structures and therefore contribute to their beauty The first is the elegance and relative simplicity of developmental algorithms that is the rules which describe plant development in time The second is self similarity characterized by Mandelbrot 95 page 34 as follows When each piece of a shape is geometrically similar to the whole both the shape and the cascade that generate it are called self similar This corresponds with the biological phenomenon described by Herman Lindenmayer and Rozenberg 61 In many growth processes of living organisms especially of plants regularly repeated appearances of certain multicellular structures are readily noticeable In the case of a compound leaf for instance some of the lobes or leaflets which are parts of a leaf at an advanced stage have the same shape as the whole leaf has at an earlier stage Thus self similarity in plants is a result of developmental processes Growth and By emphasizing the relationship between growth and form this book form follows a long tradition in biology
