

## MOUTH

Food enters the alimentary canal through the mouth. It is chewed by teeth and broken into smaller pieces. The food is mixed with saliva that contains amylase.

## LIVER

In the digestive system, the liver produces bile which helps with the digestion of fats and oils.

## GALLBLADDER

The gallbladder is where bile is stored and concentrated.

## PANCREAS

Biological catalysts called enzymes are produced in the pancreas. Digestive enzymes speed up the breaking down of large nutrient molecules.

## SMALL INTESTINES

Food is mixed with digestive enzymes and bile in the small intestines. The enzymes speed up the digestive process. Nutrients are then absorbed into the bloodstream.

## ESOPHAGUS

The fibromuscular tube connecting the mouth to the stomach is called the esophagus. Food is pushed down using a wave like muscular action called peristalsis.

## STOMACH

The stomach is the muscular organ where food is mixed with gastric juices. Gastric juice has a low pH, meaning it is acidic, and is used to help digest food and kill potentially harmful bacteria.

## LARGE INTESTINES

The large intestines are made up of two parts: the colon and the rectum. In the colon, water is reabsorbed from the food. Faeces are stored in the rectum until they are ready to be passed.

## ANUS

Faeces leave the alimentary canal through the anus.
