Authentication and authorization play key roles in ensuring security system over any communication network especially over GSM network Its explored from the literature that existing system over GSM is not enough for ensuring efficient security in terms of authentication as well as authorization The major security loophole found in the usage of OTP is that it generates the secure password that floats into GSM network where there is a higher degree of intrusion Another prominent issue found in majority of the OTP usages is that it is not preferred for mobile phones due to time synchronization that are usually based on an internal clock synchronization system The proposed study attempts to minimize the operational cost by generating the OTP on User trusted handheld device Because of this generation the system is rendered secure because it is not accessible to GSM network The system is designed on windows as well as on Android mobile environment using Java as programming tool to study the working prototype before the system can be actually deployed with an economic intention Furthermore the system is analyzed for its ability to thwart some common attacks and a comparative performance analysis is done to establish feasibility with current hardware profile and User ergonomic behavior The dissertation also exhibits a review of approaches and techniques that have been introduced in the past for the process of secure online authentication and authorization From the analysis of the system it has been seen that OTP generator for mobile hand held device takes less than 49 milliseconds on an average for different hardware profile belonging to diverse vendors The issue of feeding of longer length of One Time password is also resolved by incorporating byte to word conversion in Java which are human readable and User friendly By incorporating the same results in ergonomic efficiency The feeding time is shown to be reduced by approximately 60% with the inclusion of byte to word conversion   AI and Session Based Password Authentication Schemes for Android Kolekar Vikas K,Vaidya Milindkumar B,2015-12-24 This book will guide researchers who had keen interest to work on user authentication In this book we had discussed click based captcha and graphical password authentication schemes Implemented system inside book provides choice of various authentication schemes to user at time of login Along with these schemes session based authentication is also provided which will protect system from unauthorized access We extend the use of captcha as human present recognition as well as graphical password hence it provides all benefits of captcha and make system more powerful from security point of view   **Improving the Security of Android Unlock Patterns Using New Iterations of the Standard Lock Pattern** Timothy J. Forman,2020 Android mobile devices use a unique method of authentication in the form of a single stroke graphical pattern on a 3x3 grid that a user is required to create and recall In this research project we are going to explore improved iterations of this Android Pattern Lock in the pursuit of guiding users towards creating more secure patterns Within the past five years Mobile Authentication methods have continually progressed towards creating a more secure means to safeguard a mobile device Such methods now include biometric identification system assisted password guidance via blacklists and longer minimum passcode lengths While many methods have progressed the standard authentication interface for Android devices remains similar in comparison to its initial model In this

work we sought to explore the effects of changing the existing Android pattern lock interface to an interface we deemed the Double Pattern We examined the methodologies by which users chose their Double Patterns using our new interface specifically metrics related to the complexity of the patterns created pattern frequency within each treatment population usability aspects of the interface itself security strength of our interface and perceived security strength related to existing authentication methods Ultimately we found that our Double Pattern had a significant increase in security related to lower partial guessing entropy and lower susceptibility to simulated guessing attacks due to the low occurrence rate of each Double Pattern Equally important participants perceived the Double Pattern as a more secure interface than the original interface specifically within our users who previously utilized Android unlock patterns We are confident based on these results that the Double Pattern could be feasibly implemented as a progression of the original Android unlock pattern interface Report Documentation Page Standard Form 298 Rev 8 98
