Lifetime Oriented Structural Design Concepts:

Lifetime-Oriented Structural Design Concepts Friedhelm Stangenberg, 2009-11-26 Safety and reliability are important for the whole expected service duration of an engineering structure Therefore prognostical solutions for different building types are needed and uncertainties have to be handled Life cycle strategies to control future structural degradations by concepts of appropriate design have to be developed in case including means of inspection maintenance and repair Aspects of costs and sustainability also matter The Cooperative Research Center for Lifetime Oriented Design Concepts SFB 398 at Ruhr University in Bochum combines the wide range of scientific topics between structural engineering structural and soil mechanics and material sciences regarding structural lifetime management in this present extraordinary monolithic format The characterization and modeling of lifetime related external actions of multiple origin are presented in this book as well as the physical description the modeling and the validation of material degradation Adaptive numerical methods and simulation techniques are provided for the lifetime oriented design concepts to forecast material and structural degradation Stochastic aspects mathematical optimization methods and interactions between various influences are included Thus a solid basis is provided for future practical use and also for standardization of structural design with respect to lifetime prediction

Frangopol, 2019-12-18 Our knowledge to model design analyse maintain manage and predict the life cycle performance of

infrastructure systems is continually growing. However, the complexity of these systems continues to increase and an integrated approach is necessary to understand the effect of technological, environmental, economic, social, and political interactions on the life cycle performance of engineering infrastructure. In order to accomplish this, methods have to be developed to systematically analyse structure and infrastructure systems and models have to be formulated for evaluating and comparing the risks and benefits associated with various alternatives. Civil engineers must maximize the life cycle benefits of these systems to serve the needs of our society by selecting the best balance of the safety, economy, resilience, and sustainability requirements despite imperfect information and knowledge. Within the context of this book, the necessary concepts are introduced and illustrated with applications to civil and marine structures. This book is intended for an audience of researchers and practitioners world wide with a background in civil and marine engineering as well as people working in infrastructure maintenance management cost and optimization analysis. The chapters originally published as articles in *Structure and Infrastructure Engineering: Maintenance, Monitoring, Safety, Risk and Resilience of Bridges and Bridge Networks* (Tulio Nogueira Bittencourt, Dan Frangopol, Andre Beck, 2016-11-17). *Maintenance, Monitoring, Safety, Risk and Resilience of Bridges and Bridge Networks* contains the lectures and papers presented at the Eighth International Conference on Bridge Maintenance, Safety and Management (IABMAS 2016) held in Foz de Iguaçu, Paraná, Brazil, 26-30 June 2016. This volume consists of a book of extended abstracts and a DVD containing the full papers of 369 contributions presented at IABMAS 2016, including the T.Y. Lin Lecture, eight Keynote Lectures, and 360 technical papers from 38 countries. The contributions deal with the state of the art as well as emerging concepts and innovative applications related to all main aspects of bridge maintenance, safety, management, resilience, and sustainability. Major topics covered include advanced materials, ageing of bridges, assessment and evaluation, bridge codes, bridge diagnostics, bridge management systems, composites, damage identification, design for durability, deterioration modeling, earthquake and accidental loadings, emerging technologies, fatigue, field testing, financial planning, health monitoring, high performance materials, inspection, life cycle performance, and cost load models, maintenance strategies, non-destructive testing, optimization strategies, prediction of future traffic demands, rehabilitation, reliability and risk management, repair, replacement, residual service life, resilience, robustness, safety and serviceability, service life prediction, strengthening, structural integrity, and sustainability. This volume provides both an up-to-date overview of the field of bridge engineering as well as significant contributions to the process of making more rational decisions concerning bridge maintenance, safety, serviceability, resilience, sustainability, monitoring, risk-based management, and life cycle performance using traditional and emerging technologies for the purpose of enhancing the welfare of society. It will serve as a valuable reference to all involved with bridge structure and infrastructure systems, including students, researchers, and engineers from all areas of bridge engineering. *Production Factor Mathematics* (Martin Grötschel, Klaus Lucas, Volker Mehrmann, 2010-08-05). *Mathematics as a production factor or driving force for*

innovation Those who want to know and understand why mathematics is deeply involved in the design of products the layout of production processes and supply chains will find this book an indispensable and rich source Describing the interplay between mathematical and engineering sciences the book focusses on questions like How can mathematics improve to the improvement of technological processes and products What is happening already Where are the deficits What can we expect for the future 19 articles written by mixed teams of authors of engineering industry and mathematics offer a fascinating insight of the interaction between mathematics and engineering

Safety and performance concept. Reliability assessment of concrete structures fib Fédération internationale du béton, 2018-08-01 Concrete structures have been built for more than 100 years At first reinforced concrete was used for buildings and bridges even for those with large spans Lack of methods for structural analysis led to conservative and reliable design Application of prestressed concrete started in the 40s and strongly developed in the 60s The spans of bridges and other structures like halls industrial structures stands etc grew significantly larger At that time the knowledge of material behaviour durability and overall structural performance was substantially less developed than it is today In many countries statically determined systems with a fragile behavior were designed for cast in situ as well as precast structures Lack of redundancy resulted in a low level of

robustness in structural systems In addition the technical level of individual technologies e g grouting of prestressed cables was lower than it is today The number of concrete structures including prestressed ones is extremely high Over time and with increased loading the necessity of maintaining safety and performance parameters is impossible without careful maintenance smaller interventions strengthening and even larger reconstructions Although some claim that unsatisfactory structures should be replaced by new ones it is often impossible as authorities in general have only limited resources Most structures have to remain in service probably even longer than initially expected In order to keep the existing concrete structures in an acceptable condition the development of methods for monitoring inspection and assessment structural identification nonlinear analysis life cycle evaluation and safety and prediction of the future behaviour etc is necessary The scatter of individual input parameters must be considered as a whole This requires probabilistic approaches to individual partial problems and to the overall analysis The members of the fib Task Group 2 8 Safety and performance concepts wrote on the basis of the actual knowledge and experience a comprehensive document that provides crucial knowledge for existing structures which is also applicable to new structures This guide to good practice is divided into 10 basic chapters dealing with individual issues that are critical for activities associated with preferably existing concrete structures Bulletin 86 starts with the specification of the performance based requirements during the entire lifecycle The risk issues are described in chapter two An extensive part is devoted to structural reliability including practical engineering approaches and reliability assessment of existing structures Safety concepts for design consider the lifetime of structures and summarise safety formats from simple partial safety factors to develop approaches suitable for application in sophisticated probabilistic non linear analyses Testing for design and the determination of design values from the tests is an extremely important issue This is especially true for the evaluation of existing structures Inspection and monitoring of existing structures are essential for maintenance for the prediction of remaining service life and for the planning of interventions Chapter nine presents probabilistically based models for material degradation processes Finally case studies are presented in chapter ten The results of the concrete structures monitoring as well as their application for assessment and prediction of their future behaviour are shown The risk analysis of highway bridges was based on extensive monitoring and numerical evaluation programs Case studies perfectly illustrate the application of the methods presented in the Bulletin The information provided in this guide is very useful for practitioners and scientists It provides the reader with general procedures from the specification of requirements monitoring assessment to the prediction of the structures lifecycles However one must have a sufficiently large amount of experimental and other data e g construction experience in order to use these methods correctly This data finally allows for a statistical evaluation As it is shown in case studies extensive monitoring programs are necessary The publication of this guide and other documents developed within the fib will hopefully help convince the authorities responsible for safe and fluent traffic on bridges and other structures that the costs spent in monitoring are first rather small

and second they will repay in the form of a serious assessment providing necessary information for decision about maintenance and future of important structures

Aspects of Structural Reliability Michael H. Faber,2007

Consistent Higher Order Accurate Time Discretization Methods for Inelastic Material Models Schröder, Bettina Anna Barbara,2020-01-20 The present thesis investigates the usage of higher order accurate time integrators together with appropriate error estimators for small and finite dynamic visco plasticity Therefore a general visco plastic problem is defined which serves as a basis to create closed form solution strategies A classical access towards small and finite visco plasticity is integrated into this concept This approach is based on the idea that the balance of linear momentum is formulated in a weak sense and the material laws are included indirectly Thus separate time discretizations are implemented and an appropriate coupling between them is necessary Limitations for the usage of time integrators are the consequence In contrast an alternative multifield formulation is derived adapting the principle of Jourdain The idea is to assume that the balance of energy taking into account a pseudopotential representing dissipative effects resembles a rate type functional whose stationarity condition leads to the equations describing small or finite dynamic visco plasticity Accordingly the material laws and the balance of linear momentum can be solved on the same level and only one single time

discretization has to be performed A greater freedom in the choice of time integrators is obtained and the application of higher order accurate schemes such as Newmark's method fully implicit as well as diagonally implicit Runge Kutta schemes and continuous as well as discontinuous Galerkin methods is facilitated An analysis and a comparison of the classical and the multifield formulation is accomplished by means of distinct examples In this context a dynamic benchmark problem is developed which allows to focus on the effect of different time integrators For this investigation a variety of time discretization error estimators are formulated evaluated and compared
