

Q1.

Figure 1 shows a reflex in the iris of the human eye in response to changes in light levels.

- (a) Describe the changes in the pupil and iris going from **A** to **B** in **Figure 1**.
Explain how these changes occur.
Refer to the changes in light level in your answer.

The pupil dilates at B in all light to allow more light to enter the eye. This change occurs because the circular muscles in the iris relax while the radial muscles contract which makes the pupil large.

(4)

- (b) Some people wear glasses to improve their vision.
Figure 2 shows light entering the eye in a person with blurred vision.
Figure 3 shows how this condition is corrected with glasses.

Compare **Figure 2** and **Figure 3**.
Explain how the blurred vision is corrected.

Figure 2 shows myopia where the light doesn't focus on the retina; instead it focuses in front of the retina, therefore the image appears blurry. In Figure 3 the lens refracts (concave lens) the light so that light focuses on the retina.
