

Larry wants to buy a new or used car. However, he is only 5 years old. He knows it will take some time to save up the money to buy the car so he starts saving his money now. After his most recent birthday, he had quite a bit of cash from parties, grandparents, aunts/uncles, etc. After totaling his money, he had exactly \$100.

- a. Larry decides it is time to start investing this money from a mutual fund account so when he turns 18, and it is his own, he will be able to purchase a new or used car. The figure this will be the amount he will receive for the next 13 years, until he turns 18. He knows the current average of a new car is 2024 is \$48,000, according to Google. His first goal is to lower the \$100 into a mutual fund account so he will use "fund calculator compound interest" (google that phrase and click on the first choice) to figure up how much money he will have in 13 years. The interest rate he set 1% receiving is 8,774 and the compounding will be done monthly. He will make additional deposits of \$100 on a yearly basis with a 2.5% annual growth rate. How much will he have on his 18th birthday?

Total amount available on 18th birthday: \$15,812.50

- b. Once that is complete, he will start to research the price of new and used cars to get an idea of how much he will need for some of the cars that interest him. Here are some of the numbers he came up with where the first number (x) is the age of the car, and the second number (y) is the price of the vehicle. (0, 55000), (1, 48000), (2, 46000), (3, 40000), (4, 38000), (5, 35000), (6, 32000), (7, 30000), (8, 28000), (9, 26000), (10, 24000), (11, 22000), (12, 20000), (13, 18000), (14, 15000). Input the numbers into a table using Excel. Given these numbers, how much would you expect Larry to spend for a 5-year-old car he is interested in buying when he graduates high school? Remember to use the Linear Regression Equation $y = mx + b$ is. Don't forget to get your equation and round your numbers to one decimal place. Once you have your equation, plug 5 in for the x to find the price of a 5-year-old car.

Linear Regression Equation $y = -3110.78x + 31,947.7$

Price of a 5-year-old car \$14,396.80
(Work required to receive credit.)

$$y = -3110.78x + 31,947.7$$

- c. Now it is time to figure how much he will need to finance to purchase the car. Google "Auto Loan Calculator" and click on the first choice. Your Loan Term will be 36 months. Your Interest Rate will be 8.9%. Your Down Payment will be the number you obtained from doing the compound interest portion of the problem in Part a. Your sales tax will be 0.125%. Your title, registration, and other fees will be \$500. All other numbers will be 0. Be sure to check the box "Include All Fees in Loan". The price of the car will be what you get from your answer in Part b. What will be his monthly payment?

Monthly Car Payment \$481.97
