1. The legs of the frame SI and GI are each 5 ft long. If the crossbar WN intersects legs SI and GI at their midpoints, how far is point W from point S on the leg? Justify your answer and show all calculations.

W is 2.5 ft away from S. WN intersects SI and GI at their midpoints so divide 5 by 2 which will equal to 2.5 and then W is in the middle so the answer will be 2.5 ft.

2. The distance between point S and point G is 5 feet. Will a piece of wood that is 36 in long be long enough to replace the crossbar labeled WN? Justify your answer and show all calculations.

No it won't replace because 36 inches equal to 3 feet because WN is half of the distance between S and G which is 2.5 ft so basically 36 inches will not replace WN.

3. Assuming the ground is flat, is WN parallel to the ground? Justify with the applicable theorem.

Yes, it is because SI and GI are equal, and it is also equal to the distance from S to G. So, the triangle SIG is an equilateral triangle.

Using the centroid

4. Explain the relationship between point Z and the triangle. Justify with the applicable theorem.

Point Z is the centroid of the triangle. This is the center point of the triangle where the three medians intersect.

5. If the length of GU is 18 units, what is the length of GZ? Show all your calculations and unit measurements.

If the measure of GU is 18 units, the length of GZ is 12 units since the theorem states that the shorter side is $\frac{1}{3}$ of the entire segment and the longer side is $\frac{2}{3}$ of the segment.

6. If the length of ZT is 4.8 units, what is the length of OT? Show all your calculations and unit measurements.

The length of OT is 14.4 units. The theorem states that the shorter side is $\frac{1}{3}$ of the entire segment and the longer side is $\frac{2}{3}$ of the segment. So, I multiply 4.8 by 3 which will equal 14.4.
