

## Biology Essential Standard 1.1

Understand the relationship between the structures and functions of cells and their organelles.

### Bio.1.1.1 Summarize the structure and function of organelles in eukaryotic cells

Match these organelles with their functions:

- |                    |   |                                                                   |
|--------------------|---|-------------------------------------------------------------------|
| a. Nucleus         | 3 | 1. Sites of photosynthesis, contain chlorophyll.                  |
| b. Plasma Membrane | 5 | 2. Powerhouse of the cell, where cell respiration occurs.         |
| c. Cell Wall       | 6 | 3. Brain of the cell, contains the DNA & chromosomes.             |
| d. Mitochondria    | 2 | 4. Sites of protein synthesis, where mRNA & tRNA meet.            |
| e. Vacuoles        | 7 | 5. Cell's outer boundary, lipids & proteins, semipermeable.       |
| f. Chloroplasts    | 1 | 6. Found in plants only to maintain structure, not semipermeable. |
| g. Ribosomes       | 4 | 7. Large in plants, small in animals, used for storage.           |

- Describe how these organelles interact with each other to perform the function of the cell:
  - Nucleus and ribosome – DNA makes mRNA in the nucleus and sends it to the ribosome
  - Plasma membrane and mitochondria – plasma membrane takes in glucose and oxygen that is needed by the mitochondria for cell respiration. The PM also releases CO<sub>2</sub> from the process.
  - Cell wall and vacuole – as water goes into the vacuole, osmotic pressure builds up in the cell and the cell doesn't burst due to the strength of the cell wall.
  - Cell wall and chloroplasts - since the cell wall is not semipermeable, the materials needed for photosynthesis flow freely into the cell.
- Draw a plant and animal cell and label the above organelles: please google animal cell and plant cell to check your drawings!!!
- Explain how the structure of each organelle determines its function. (Example: folded inner membrane in mitochondria increases surface area for energy production during aerobic cellular respiration).  
Nucleus – the semipermeable double-layered membrane of the nucleus keeps DNA and other substances in the nucleus and other things out

Plasma membrane – the semipermeable lipid bi-layer allows certain substances into the cell and keeps other substances out

Cell wall – the cell wall's stringy cellulose structure allows for everything to pass through while still maintaining structure when osmotic pressure increases

Mitochondria – see the question

Vacuoles – the single membrane and fluid contents of the vacuole help it store items

Chloroplast – the double membranes of the chloroplast allow for maximum absorption of sunlight

Ribosomes – consists of 2 parts – one part allows attachment of the mRNA and the other part allows for attachment of tRNA and amino acids during protein synthesis.

- Summarize how these organelles interact to carry out life functions (Example: DNA codes for proteins which are assembled by the ribosomes and used as enzymes for energy production at the mitochondria).  
Match these:

|                               |   |                                                                   |
|-------------------------------|---|-------------------------------------------------------------------|
| a. energy production and use  | 3 | 1. Wastes stored in vacuole are sent to plasma membrane.          |
| b. transport of molecules     | 2 | 2. Plasma membrane allows entrance, cytoplasm circulates.         |
| c. disposal of waste          | 1 | 3. Mitochondria makes ATP, ribosome uses it in protein synthesis. |
| d. synthesis of new molecules | 4 | 4. Nucleus sends mRNA to ribosome, tRNA brings AA to put          |
