How does the cell membrane control movement of materials?

## Why?

The membrane is critical to the maintenance of homeostasis in living organisms. The cell membrane separates the cell from the external environment and plays a critical role in regulating movement of material in and out of the cell. Additionally, eukaryotic cells are made complex by the presence of internal membranes that form organelles, so the cells may become specialized. These organelle membranes create compartments within the cell that can do specific functions.

## Model 1 – Types of Ions and Molecules in a Cell

Type 1 Ions	Type 2 Molecules	Type 3 Molecules	Type 4 Molecules
Potassium: $K^+$	Glucose: 	Water:  Urea: 	Molecular oxygen ( $O_2$ ):  Carbon dioxide ( $CO_2$ ): 
Sodium: $Na^+$			
Calcium: $Ca^{2+}$			
Chloride: $Cl^-$			
Polar	polar	Polar	nonpolar
small	large	Small	Small

- Consider the ions and molecules in Model 1.
  - Identify at least two substances that would need to move into a cell to maintain homeostasis.  
Cells need water and oxygen to maintain homeostasis.
  - Briefly explain why the cell needs each of the substances you identified in part a.  
Oxygen is needed to help create ATP for energy for cells, where as water is used to break things down and cause reactions like protein synthesis within cells.
- Consider the ions and molecules in Model 1.
  - Identify at least two substances that would need to move out of a cell to maintain homeostasis.  
Glucose and Carbon Dioxide ( $CO_2$ ).
  - Briefly explain the source of the molecules you identified in part a.  
Glucose is needed around the cells to help stimulate energy, and carbon dioxide is used to help breakdown oxygen for plant cells to use.
- Complete the table by labeling the types of substances as polar or nonpolar and large or small.

## Membrane Function Pogil Key:

*Control of Membrane Function: short-term and long-term* J.M. Ritchie, P. Magistretti, L. Bolis, 2012-12-02 A critical factor in cell to cell interactions is the presence in the cell membrane of highly specific ion channels controlled by specific receptors that are bound to and activated by a gamut of external hormones and neurotransmitters Through both this action on ion channels and action on other membrane components such as G proteins extracellular signals alter intracellular events usually through the mediation of second messengers and so provide the basis for the transduction mechanism connecting extracellular signals with intracellular effectors This volume deals with the various ways that such membrane function is controlled

is now general acceptance of the fluid mosaic model of membrane structure and of the chemiosmotic interpretation of energetic processes and our attention has shifted from justifying these ideas to explaining membrane functions in their terms. Much more information has become available concerning the role of the plasma membrane in the cell's recognition of and response to external signals and this is reflected in the increased coverage of these topics in the book. The general form of the book remains the same. As before, a list of suggested reading, subdivided by chapter, is provided and this has been expanded to include a greater proportion of original papers. The book is still primarily designed as an advanced undergraduate text and also to serve as an introduction for postgraduate workers entering the field of membrane research. We have taken cognizance of the comments of many reviewers, colleagues and students on the first edition and thank them for their contributions. In particular, we wish to acknowledge our colleagues R. Eisinger, G. D. Holman, D. W. Hough and A. H. Rose. Dr. C. R. Membrane Organization and Dynamics Amitabha Chattopadhyay, 2017-12-06. This volume brings together information on membrane organization and dynamics from a variety of spectroscopic, microscopic and simulation approaches spanning a broad range of time scales. The implication of such dynamic information on membrane function in health and disease is a topic of contemporary interest. The chapters cover various aspects of membrane lipid and protein dynamics explored using a battery of experimental and theoretical approaches. The synthesis of information and knowledge gained by utilizing multiple approaches will provide the reader with a comprehensive understanding of the underlying membrane dynamics and function which will help to develop robust dynamic models for the understanding of membrane function in healthy and diseased states. In the last few years, crystal structures of an impressive number of membrane proteins have been reported thanks to tremendous advances in membrane protein crystallization techniques. Some of these recently solved structures belong to the G protein coupled receptor (GPCR) family which are particularly difficult to crystallize due to their intrinsic flexibility. Nonetheless, these static structures do not provide the necessary information to understand the function of membrane proteins in the complex membrane milieu. This volume will address the dynamic nature of membrane proteins within the membrane and will provide the reader with an up-to-date overview of the theory and practical approaches that can be used. This volume will be invaluable to researchers working in a wide range of scientific areas from biochemistry and molecular biology to biophysics and protein science. Students of these fields will also find this volume very useful. This book will also be of great use to those who are interested in the dynamic nature of biological processes.
