How does the cell membrane control movement of materials?

## Why?

The membrane is critical to the maintenance of homeostasis in living organisms. The cell membrane separates the cell from the external environment and plays a critical role in regulating movement of material in and out of the cell. Additionally, eukaryotic cells are made complex by the presence of internal membranes that form organelles, so the cells may become specialized. These organelle membranes create compartments within the cell that can do specific functions.

## Model 1 – Types of Ions and Molecules in a Cell

Type 1 Ions	Type 2 Molecules	Type 3 Molecules	Type 4 Molecules
Potassium: $K^+$	Glucose: 	Water:  Urea: 	Molecular oxygen ( $O_2$ ):  Carbon dioxide ( $CO_2$ ): 
Sodium: $Na^+$			
Calcium: $Ca^{2+}$			
Chloride: $Cl^-$			
Polar	polar	Polar	nonpolar
small	large	Small	Small

- Consider the ions and molecules in Model 1.
  - Identify at least two substances that would need to move into a cell to maintain homeostasis.  
Cells need water and oxygen to maintain homeostasis.
  - Briefly explain why the cell needs each of the substances you identified in part a.  
Oxygen is needed to help create ATP for energy for cells, where as water is used to break things down and cause reactions like protein synthesis within cells.
- Consider the ions and molecules in Model 1.
  - Identify at least two substances that would need to move out of a cell to maintain homeostasis.  
Glucose and Carbon Dioxide ( $CO_2$ ).
  - Briefly explain the source of the molecules you identified in part a.  
Glucose is needed around the cells to help stimulate energy, and carbon dioxide is used to help breakdown oxygen for plant cells to use.
- Complete the table by labeling the types of substances as polar or nonpolar and large or small.

**The Molecular Basis of Membrane Function** Society of General Physiologists, 1969      **Control of Membrane Function: short-term and long-term** J.M. Ritchie, P. Magistretti, L. Bolis, 2012-12-02 A critical factor in cell to cell interactions is the presence in the cell membrane of highly specific ion channels controlled by specific receptors that are bound to and activated by a gamut of external hormones and neurotransmitters Through both this action on ion channels and action on other membrane components such as G proteins extracellular signals alter intracellular events usually through the mediation of second messengers and so provide the basis for the transduction mechanism connecting extracellular signals with intracellular effectors This volume deals with the various ways that such membrane function is controlled      **PreTest**

Structure and Function of Biological Membranes Lawrence I. Rothfield, 2014-06-28

Structure and Function of Biological Membranes explains the membrane phenomena at the molecular level through the use of biochemical and biophysical approaches The book is an in depth study of the structure and function of membranes It is divided into three main parts The first part provides an overview of the study of the biological membrane at the molecular level Part II focuses on the detailed description of the overall molecular organization of membranes The third part covers the relationship of the molecular organization of membranes to specific membrane functions discusses catalytic membrane proteins presents the role of membranes in important cellular functions and looks at the membrane systems in eukaryotic cells Biochemists cell physiologists biologists researchers and graduate and postdoctoral students in the field of biology will find the text a good reference material
