

Theory

Heat transfer is defined as the transmission of energy from one region to another as a result of temperature gradient takes places by the following three modes:

- 1. Conduction
- 2. Convection
- 3. Radiation

Conduction is the transfer of heat from one part of a substance to another part of the same substance or from one substance to another in physical contact with it, without appreciable displacement of molecules forming the substance.

Fourier's law of heat conduction states that the rate of flow of heat through a simple homogeneous solid is directly proportional to the area of the section at right angles to the direction of heat flow, to the change of temperature with respect to the length of the path of the heat flow.
